

# CONTENTS OF VOLUME 1

---

<i>Contents of Volume 2</i>	viii
<i>Preface</i>	xi
<b>1 Linear transformations of the plane</b>	<b>1</b>
1.1 Affine planes and vector spaces	7
1.2 Vector spaces and their affine spaces	13
1.3 Functions and affine functions	16
1.4 Euclidean and affine transformations	18
1.5 Linear transformations	21
1.6 The matrix of a linear transformation	22
1.7 Matrix multiplication	24
1.8 Matrix algebra	26
1.9 Areas and determinants	32
1.10 Inverses	36
1.11 Singular matrices	39
1.12 Two-dimensional vector spaces	43
Appendix: the fundamental theorem of affine geometry	45
Summary	45
Exercises	46
<b>2 Eigenvectors and eigenvalues</b>	<b>55</b>
2.1 Conformal linear transformations	55
2.2 Eigenvectors and eigenvalues	58
2.3 Markov processes	66
Summary	72
Exercises	73
<b>3 Linear differential equations in the plane</b>	<b>81</b>
3.1 Functions of matrices	81
3.2 The exponential of a matrix	83
3.3 Computing the exponential of a matrix	89
3.4 Differential equations and phase portraits	95
3.5 Applications of differential equations	103
Summary	113
Exercises	113
<b>4 Scalar products</b>	<b>120</b>
4.1 The euclidean scalar product	120

## Contents of Volume 1

4.2	The Gram–Schmidt process	124
4.3	Quadratic forms and symmetric matrices	131
4.4	Normal modes	137
4.5	Normal modes in higher dimensions	141
4.6	Special relativity	148
4.7	The Poincaré group and the Galilean group	157
4.8	Momentum, energy and mass	160
4.9	Antisymmetric forms	166
	Summary	167
	Exercises	168
<b>5</b>	<b>Calculus in the plane</b>	<b>175</b>
	Introduction	175
5.1	Big ‘oh’ and little ‘oh’	178
5.2	The differential calculus	183
5.3	More examples of the chain rule	189
5.4	Partial derivatives and differential forms	197
5.5	Directional derivatives	205
5.6	The pullback notation	209
	Summary	214
	Exercises	215
<b>6</b>	<b>Theorems of the differential calculus</b>	<b>219</b>
6.1	The mean-value theorem	219
6.2	Higher derivatives and Taylor’s formula	222
6.3	The inverse function theorem	230
6.4	Behavior near a critical point	240
	Summary	242
	Exercises	242
<b>7</b>	<b>Differential forms and line integrals</b>	<b>247</b>
	Introduction	247
7.1	Paths and line integrals	250
7.2	Arc length	264
	Summary	266
	Exercises	267
<b>8</b>	<b>Double integrals</b>	<b>272</b>
8.1	Exterior derivative	272
8.2	Two-forms	277
8.3	Integrating two-forms	278
8.4	Orientation	285
8.5	Pullback and integration for two-forms	289
8.6	Two-forms in three-space	295
8.7	The difference between two-forms and densities	297
8.8	Green’s theorem in the plane	298
	Summary	305
	Exercises	306
<b>9</b>	<b>Gaussian optics</b>	<b>311</b>
9.1	Theories of optics	311

9.2	Matrix methods	315
9.3	Hamilton's method in Gaussian optics	324
9.4	Fermat's principle	326
9.5	From Gaussian optics to linear optics	328
	Summary	335
	Exercises	335
<b>10</b>	<b>Vector spaces and linear transformations</b>	<b>340</b>
	Introduction	340
10.1	Properties of vector spaces	341
10.2	The dual space	342
10.3	Subspaces	343
10.4	Dimension and basis	345
10.5	The dual basis	350
10.6	Quotient spaces	352
10.7	Linear transformations	358
10.8	Row reduction	360
10.9	The constant rank theorem	368
10.10	The adjoint transformation	374
	Summary	377
	Exercises	378
<b>11</b>	<b>Determinants</b>	<b>388</b>
	Introduction	388
11.1	Axioms for determinants	389
11.2	The multiplication law and other consequences of the axioms	396
11.3	The existence of determinants	397
	Summary	399
	Exercises	399
	<b>Further reading</b>	<b>401</b>
	<b>Index</b>	<b>404</b>
