I – Introduction to Self-Reference and Recursion

1	Introduction to self-reference	1
	Part I Quotation and self-reference	2
	§1 Use and mention	2
	§2 Self-reference using diagonalization	3
	§3 Normalization	4
	§4 One-sided quotation	7
	§5 Cross-reference using one-sided quotation	9
	§6 Some general principles concerning designational systems	12
	§7 A pseudo-quotational system	14
	§8 Some other methods of self-reference	15
	Part II Self-reference in a more general setting	16
	§9 A more general setting	16
	§10 Applications to quotational systems	17
	§11 Near Diagonalization	18
	§12 Cross-reference	19
	§13 Application to one-sided quotational systems	20
2	Some classical fixed point arguments compared	25
	Part I Five fixed point arguments	25
	§1 An argument from combinatory logic	25
	§2 Gödel sentences	26
	§3 An argument from recursion theory	27
	§4 Another argument from recursion theory	28
	§5 Self-reproducing machines	29
	Part II A unification	31
	§6 A relational fixed point theorem	31
	Part III Quasi-diagonalization	34
	§7 Some stronger results	34
3	How to silence a universal machine	39

Part I	Silencing a universal machine	39
§1	A universal machine	39
Part II	Some related problems	43
Part III	Solutions to problems	44
4	Some general incompleteness theorems	48
Part I	Incompleteness	50
§1	Diagonalization	50
§2	An incompleteness argument using a truth set	52
§3	Gödel's argument and some variations	56
§4	Rosser's argument	59
§5	Complete representability and definability	63
§6	Admissible functions	67
§7	Kleene's symmetric incompleteness theorem generalized	68
Part II	Provability by stages	69
§8	Provability by stages	69
5	Self-reference in arithmetic	75
Part I	Normalization and Tarskification	75
§1	Normalization in arithmetic	75
§2	Tarski's method of achieving self-reference	81
§3	The more general situation	84
Part II	Some special devices	85
§4	Near normalization	85
§5	Situation in Polish notation	87
§6	More on quotational systems	88
§7	Some variants	90
Part III	Generalizations	91
§8	Gödelizing operations	91
§9	Generalized diagonalization	93
6	Introduction to formal systems and recursion	97
Part I	Formal representability	97
§1	Elementary formal systems	97
§2	Some basic closure properties	105
§3	Solvability over K	110
Part II	Recursive enumerability	113
§4	Recursively enumerable relations	113
§5	Recursive functions	118
§6	Finite quantifications and constructive definability	122
§7	Recursive pairing functions	126
§8	Dyadic Gödel numbering	129

§9	Lexicographical Gödel numbering and n -adic notation	132
7	A universal system and its applications	135
Part I	A universal system	135
§1	The universal system (U)	135
§2	The recursive unsolvability of (U)	139
Part II	Enumeration and iteration theorems	141
§3	The enumeration theorem	141
§4	Iteration theorem	144
II – Systems with Effective Properties		
8	Arithmetization of formal systems	149
Part I	Arithmetization of elementary formal systems	149
§1	Some facts about Σ_0 -relations	150
§2	Arithmetization of elementary formal systems	154
Part II	Double enumeration	156
§3	Some applications	156
Part III	More on arithmetization	159
§4	All r.e. relations are Σ_1	159
§5	More on arithmetization (optional)	161
9	Elementary formal systems and incompleteness proofs	165
Part I	Truth in \mathcal{L}_0 cannot be formalized	166
§1	The non-formalizability of arithmetic truth	166
Part II	A concrete incompleteness proof	169
§2	Peano arithmetic	169
§3	Peano arithmetic is a formal system	170
§4	The Gödel and Rosser proofs	174
10	Doubly indexed relational systems	176
Part I	Indexed relational systems	176
§0	Definitions	176
§1	Universal sets	178
§2	Generative sets	179
Part II	Double indexing	182
§3	Double enumeration and double universality	182
§4	Doubly generative pairs	187
§5	Semi-D.G. pairs	190
§6	Closing the circle	195
§7	Summary of main results	198
11	Effective representation systems	200
Part I	Effective representation	200

§1	Undecidability	201
§2	Generative systems	204
§3	Doubly generative systems	205
§4	Rosser systems	207
§5	Extensions	210
Part II	Exact and effective Rosser systems	212
§6	Exact Rosser systems	212
§7	Variations on a theme by Shepherdson	214
§8	Effective Rosser systems	219
§9	Some simpler related results	223
§10	Unconquerable systems and omniscient functions	223

III – Fixed Point Theorems in a General Setting

12	Sequential systems	228
Part I	Definitions and purpose	228
Part II	Preliminary definitions	233
§1	Types 0,1,2	233
Part III	Some fixed point properties	236
§2	The weak fixed point property	236
§3	Universal systems and the weak Kleene property	239
§4	Integrated systems	241
Part IV	Summary and applications	242
13	Strong fixed point properties	245
Part I	The recursion and extended recursion properties	245
§1	The recursion property	245
§2	A type 2 approach	249
§3	The extended recursion property	251
Part II	The Myhill property and related properties	252
§4	Strongly connected systems	253
§5	The Myhill and recursion properties compared	255
§6	Very strong connectivity	256
§7	Universal integrated systems	257
§8	The strong Kleene property	258
Part III	Summary and applications	259
I	Indexed relational systems	260
II	Sentential systems	261
III	Applicative systems	262
14	Multiple fixed point properties	263
Part I	Double fixed points	263
§1	The weak double fixed point property	263

Part II	Double recursion properties	267
§2	Double recursion	267
§3	A type 2 approach	269
Part III	Double Myhill properties and related results	273
§4	The double Myhill property	273
§5	The properties DM_k	277
§6	Very Strongly Connected Systems	278
§7	Integrated systems of type 1	278
Part IV	Symmetric functions and nice functions	279
§8	Symmetric functions	279
§9	Nice functions	281
§10	Universal systems of type 2	283
§11	Multiple fixed point properties	284
15	Synchronization and pairing functions	286
Part I	Synchronized fixed point properties	286
§0	Synchronized sequences of functions	286
§1	Synchronized fixed point theorems	288
§2	Relation to multiple fixed point properties	290
Part II	Pairing functions	292
§3	Exact and quasi-exact functions	293
§4	Some consequences	296
§5	Strongly connected systems of type 1*	297
Part III	Synchronized recursion resumed	299
§6	The property DR*	299
§7	The property DM*	301
§8	Integrated systems of type I*	302
16	Some further relations between fixed point properties	304
Part I	Single and double fixed point properties compared	304
§1	Recursion and double fixed points	304
§2	Recursion and double recursion	306
§3	Systems of type 1*	307
§4	Myhill and double Myhill properties	308
Part II	More on systems of type 1*	309
§5	Bar fixed points	309
§6	Further topics	311

IV – Combinators and Sequential Systems

17	Fixed point properties of combinatory logic	315
Part I	Interdefinability of some combinators	315
§1	The combinator B	316

§2	We add T	317
§3	We add M	320
§4	Two special combinators	324
§5	The combinator I	325
§6	A basis equivalent to $\{B, T, I\}$	326
§7	Some curiosities	326
§8	We now consider K	327
§9	Idempotent and voracious elements	329
Part II	Fixed points	329
§10	Some sufficient conditions	329
§11	Fixed points in relation to idempotent and voracious elements	330
§12	A fixed point principle	330
§13	Some fixed point combinators	331
§14	Turing sages	333
§15	Some special properties of O	333
§16	Sages from B and W	334
§17	n -sages	335
Part III	Multiple fixed points	336
§18	Some more useful combinators	336
§19	The cross-point property	336
§20	The weak double fixed point property	337
§21	The property DM	338
§22	Nice combinators and symmetric combinators	339
18	Formal combinatory logic	357
Part I	The axiom systems CL and CL_0	357
§1	Formal combinatory logic	357
§2	Consistency and models	360
§3	Extensional combinatory logic	361
19	A second variety of fixed point theorems	366
Part I	Self-reference in CL_0	366
§1	Admissible name functions	366
§2	Admissible maps via numeral systems	371
Part II	Fixed point theorems of the second type	373
§3	The second fixed point theorem	373
§4	Applications	374
§5	Other fixed point theorems of the second variety	378
20	Extended sequential systems	380
§0	M -diagonalizers	381

§1	M -fixed points	382
§2	The double M -fixed point theorem	383
§3	Strong M -fixed point properties	384
§4	Uniform double M -fixed point properties	387
§5	M -nice and M -symmetric functions	388
