Introduction	1
1 Stability theory	7
1 Structures and imaginary elements	7
2 Forking	13
3 Ranks	30
4 Miscellaneous facts about stable theories	40
4.1 λ -stability and λ -saturation	40
4.2 $\kappa(T)$ and the category of a -models	41
4.3 Orthogonality and domination	43
4.4 Weight	46
4.5 Regular types	48
5 Weakly minimal sets and unidimensional theories	52
6 Stable groups	62
2 The classical finite rank theory	75
1 Geometries and pregeometries	75
2 Minimal types and linearity	79
3 The dichotomy theorem	82
4 Zilber's theorem	85
5 'Coordinatization' in theories of finite U -rank	99
6 Totally categorical structures	106
3 Quasifinite axiomatizability	114
1 ω -categoricity and automorphism groups	114
2 ω -categorical, ω -stable structures	122
3 Nice enumerations and a special case of the main theorem	125
4 Pregood sets and good sets	134
5 The proof of quasifinite axiomatizability	144
4 1-based theories and groups	152
1 Weakly normal formulae and pseudoplanes	152
2 1-based trivial theories	158
3 Weight and theories with no dense forking chains	164
4 1-based groups	168

5	Minimal locally modular groups	174
6	Reducts of 1-based theories	181
5	Groups and geometries	185
1	Locally modular non-trivial minimal types: construction of a group	185
2	The geometry of a locally modular type	192
3	A variant: pseudolinearity	200
4	The group configuration for stable theories	204
6	Unidimensional theories	214
1	Groups and envelopes	214
2	Theories categorical in a higher power	221
3	Countable small unidimensional theories	228
4	Newelski's lemma	238
5	Countable models of unidimensional theories	244
7	Regular types	253
1	p -weight	253
2	Local modularity	264
3	Group existence theorems	275
4	Internality	278
5	p -simple groups	286
6	Geometries	294
8	Superstable theories	298
1	Analysability	298
2	Definability of analysability and weight	306
3	Existence of regular types	319
4	NDOP and types depth 0	325
5	Generalized existence and dichotomy theorems	332
	Notes on chapters	342
