X 1. INTRODUCTION: INDUSTRIAL SOCIETY AND SOCIAL MOBILITY	1
2. CONCEPTS, DATA, AND STRATEGIES OF ENQUIRY	28
3. TRENDS IN CLASS MOBILITY	65
<i>Annex: The Moving Average Graduation Method</i> <i>Jan M. Hoem</i>	107
4. SOCIAL FLUIDITY WITHIN CLASS STRUCTURES: MODELLING THE FJH HYPOTHESIS	114
5. SOCIAL FLUIDITY WITHIN CLASS STRUCTURES: COMMONALITY AND VARIATION	141
<i>Annex: Comparing Cell-Interaction Parameters under</i> <i>Different Versions of the Core Model</i>	182
6. ABSOLUTE RATES OF CLASS MOBILITY	188
<i>Annex: Partitioning Variance in Logged Odds between</i> <i>Expected Cell Values</i>	228
X 7. THE CLASS MOBILITY OF WOMEN	231
X 8. WORK-LIFE AND INTERGENERATIONAL CLASS MOBILITY	278
9. NON-EUROPEAN CASES: I. THE UNITED STATES AND AUSTRALIA	308
10. NON-EUROPEAN CASES: II. JAPAN	338
11. CONCLUSIONS AND PROSPECTS	365
<i>Bibliography</i>	399
<i>Index of Names</i>	423
<i>Subject Index</i>	428

# FIGURES

- 2.1. The derivation of the class schema
- 3.1. Total labour force engaged outside agriculture
- 3.2. Real GNP per capita (1960 US\$ and prices)
- 3.3. Total mobility rates for men in nine nations by birth year
- 3.4. Outflow rates from farm origins to farm destinations for men in nine nations by birth year
- 3.5. Outflow rates from farm origins to manual destinations for men in nine nations by birth year
- 3.6. Outflow rates from farm origins to non-manual destinations for men in nine nations by birth year
- 3.7. Outflow rates from manual origins to non-manual destinations for men in nine nations by birth year
- 3.8. Outflow rates from non-manual origins to manual destinations for men in nine nations by birth year
- 3.9. Outflow rates from farm origins to service-class destinations for men in nine nations by birth year
- 3.10. Outflow rates from manual origins to service-class destinations for men in nine nations by birth year
- A3.1. Raw and graduated Swedish outflow rates from farm origins to non-manual destinations, by cohort number
- A3.2. Polygonal representations of Swedish outflow rates from farm origins to non-manual destinations
- A3.3. Hungarian outflow rates from farm origins to non-manual destinations, by birth year
- 4.1. Three-dimensional (ALSCAL) solution for distances between national patterns of social fluidity for nine nations, Kruskal's stress formula 1 = 0.066
- 4.2. Three-dimensional (ALSCAL) solution for distances between national patterns of social fluidity for fifteen nations, Kruskal's stress formula 1 = 0.111
- 6.1. Cross-national ranges of inflow rates
- 6.2. Cross-national ranges of outflow rates
- 8.1. Outflows to entry class and destination class by origin class, men aged 20-64
- 9.1. European ranges of inflow rates and position of US and Australian rates
- 9.2. European ranges of outflow rates and position of US and Australian rates
- 10.1. European ranges of inflow rates and position of Japanese rates
- 10.2. European ranges of outflow rates and position of Japanese rates

# TABLES

- 2.1. The class schema
- 2.2. Scores for classes of the schema on different occupational scales as a basis for a threefold hierarchical division
- 2.3. National enquiries used as data sources
- 3.1. Results of fitting the CnSF model to intergenerational class mobility tables for four birth-cohorts
- 3.2. Improvement in fit over the CnSF model and parameters for (i) the model of uniform change in association between class origins and destinations, and (ii) the model of change in level of association in main diagonal cells
- 3.3. Results of fitting the CmSF model to intergenerational class mobility tables by nation for four ten-year birth-cohorts
- 3.4. Results of fitting different models of social fluidity to intergenerational class mobility tables by nation and birth-cohort
- A3.1. Graduation coefficients for the symmetric twenty-one-term minimum- $R_1$  moving average
  - 4.1. Results of fitting the CmSF model to intergenerational class mobility tables for nine nations
  - 4.2. Results of fitting the model of core social fluidity to counterfactual tables showing mobility in nine nations as it would be under core fluidity as empirically derived
  - 4.3. Postulated effects of hierarchy, inheritance, sector, and affinity in the cells of the  $7 \times 7$  intergenerational class mobility table
  - 4.4. Parameters for effects in the model of core social fluidity, and resulting interaction parameters in the cells of the  $7 \times 7$  intergenerational class mobility table
- 5.1. Results of fitting the model of core social fluidity to national mobility tables (i) with cross-nationally common parameters; (ii) with nation-specific parameters; (iii) with effects modified or added
- 5.2. Results of testing for the significance of differences between values of effect parameters estimated for nine nations and for the core model
- 5.3. Effect parameters of accepted models
- 5.4. Results of fitting the national variant model for Northern Ireland to mobility tables for Protestant and Roman Catholic subpopulations separately, and effect parameters estimated
- 5.5. Results of fitting the model of core social fluidity to mobility tables for three additional nations: (i) with cross-nationally common parameters; (ii) with nation-specific parameters; (iii) with effects modified or added
- 5.6. Effect parameters of accepted models for three additional nations

- A5.1. Differences between cell-interaction parameters under national variant models and the neutral-fluidity level compared, in percentage terms, with the corresponding differences under the core model
- 6.1. Total mobility rates as between manual and non-manual classes for men of non-farm origins in non-farm destinations
- 6.2. Distributions of respondents, men aged 20–64, to national mobility enquiries by class of origin and destination
- 6.3. Decomposition of total mobility rates
- 6.4. Ranges and medians of  $\Delta$  values for pairwise comparisons of national inflow and outflow distributions
- 6.5. Range of differences in shift parameters estimated under national variant models
- 6.6. Partitioning of variance in logged odds of expected cell frequencies under different models of national mobility tables
- 6.7. Total mobility rates calculated from (i) observed mobility tables, (ii) tables as expected under national variant models, and (iii) tables as expected under model of core social fluidity
- 6.8. Indices of homogeneity of classes in terms of members' class origins expressed as percentage of minimum value
- 6.9. Intergenerational stability rates of classes
- 6.10. Work-life stability rates of classes
- 6.11. Mobility characteristics of classes
- 7.1. Information available and unavailable in national data-sets relevant to the mobility of women
- 7.2. Distribution of women and men by class of origin and current employment
- 7.3.  $\Delta$  values for men's and women's outflow rates from class origins to current employment
- 7.4. Total mobility rates for women from class origins to current employment
- 7.5. Results of fitting the CmSF model to tables on men's and women's mobility from class origins to current employment and  $\beta$  parameters for women from the model of uniform difference
- 7.6. Results of fitting the CmSF model to mobility tables for women's mobility and for women's and men's mobility from class origins to current employment for five nations
- 7.7.  $\Delta$  values for outflow rates for marital mobility of women and intergenerational mobility of married men
- 7.8. Total mobility rates for marital mobility of women and intergenerational mobility of married men
- 7.9. Total upward and total downward mobility rates for women's marital mobility and married men's intergenerational mobility

- 7.10. Results of fitting the CmSF model to tables of women's marital mobility and married men's intergenerational mobility and  $\beta$  parameters for women from the model of uniform difference
- 7.11. Results of fitting models to three-way tables of wife's father's class by wife's class (via own employment) by husband's class
- 7.12. Results of fitting models to three-way tables of husband's father's class by husband's class by wife's class (via own employment)
- 7.13. Composition of complete tables: percentage distribution of types of unit represented using the dominance method
- 7.14. Distributions of destination class from complete and 'men-only' mobility tables
- 7.15. Total mobility rates for complete and 'men-only' tables
- 7.16.  $\Delta$  values for outflow rates from complete and 'men-only' mobility tables
- 7.17. Results of fitting national variants of the model of core social fluidity to complete tables: (i) with parameters estimated from 'men-only' tables; (ii) with parameters being allowed to vary
- 8.1. Summary measures calculated from three-way class mobility tables
- 8.2. Results of fitting the CmSF model to tables representing different transitions within three-way mobility tables for England, France, Hungary, and Poland
- 8.3. Results of fitting the CmSF model to tables representing different transitions within three-way mobility tables for England, France, Hungary, and Poland with pairwise restrictions
- 8.4. Results of fitting models to three-way mobility tables for England, France, Hungary, and Poland
- 9.1. Results of fitting the model of core social fluidity to mobility tables for the United States and Australia: (i) with cross-nationally common parameters; (ii) with nation-specific parameters; (iii) with effects modified or added
- 9.2. Effect parameters of accepted models for the United States and Australia
- 9.3. Distributions of respondents to US and Australian mobility enquiries, by class of origin and destination, and corresponding ranges for European nations
- 9.4. Decomposition of total mobility rates for the United States and Australia and ranges for European nations
- 9.5. Work-life outflow mobility rates between selected classes, men aged 35–64
- 10.1. Results of fitting the model of core social fluidity to the Japanese mobility table: (i) with cross-nationally common parameters; (ii) with nation-specific parameters; (iii) with effects modified or added
- 10.2. Effect parameters of accepted model for Japan
- 10.3. Distributions of respondents to the Japanese mobility enquiry, men aged 20–64, by class of origin and destination, and corresponding ranges for European nations

- 10.4. Differences in shift parameters estimated under the national variant model for Japan
- 10.5. Decomposition of total mobility rates for Japan and ranges for European nations
- 11.1. Ranking of nations by overall fluidity and allocation to levels of four independent variables
- 11.2. Results of fitting the uniform-difference, and also the conditional independence and CmSF, models to intergenerational class mobility tables for fifteen nations
- 11.3. Improvement in fit over CmSF model produced by the extended uniform-difference model with from one to four independent variables,  $\Delta$  values, and parameter estimates for levels of independent variables
