

CONTENTS

Preface to the English edition	7
--------------------------------------	---

Part I

Evolution of the space concept up to the discovery of non-Euclidean geometry	9
--	---

1. From the empirical study of space to deductive geometry	11
2. Attempts to prove Postulate 5	14
3. Reviving investigations at the beginning of the 19th century	19
4. The meditations of Gauss, and their results	27
5. The geometric investigations of Lobachevsky	29
6. The mathematical studies of János Bolyai	31
7. The discovery of absolute geometry	32

Part II

The absolute geometry of János Bolyai

The Appendix	39
--------------	----

Appendix (facsimile)	41
Appendix (translation)	71
Explanation of signs	73
I. Parallelism (§§ 1—10)	75
II. The paracycle and the parasphere (§§ 11—24)	83
III. Trigonometry (§§ 25—31)	92
IV. Application of the methods of analysis, relation between geometry and reality (§§ 32—33)	102
V. Constructions (§§ 34—43)	109

Part III

Remarks	121
---------	-----

The Hilbertian system of axioms for Euclidean geometry	123
Remarks to §§ 1—43	127

Part IV

The work of Bolyai as reflected by subsequent investigations

177

I. The construction of geometry by elementary methods	181
1. Further investigations of János Bolyai in the field of absolute geometry	181
2. Elliptic geometry	182
3. The commentary literature	183
4. Foundation of hyperbolic plane geometry without using the axioms of continuity	185
II. The consistency of non-Euclidean geometries	192
5. On the proof of the consistency	192
6. Beltrami's model	194
7. The Cayley-Klein model	197
8. Poincaré's model	207
III. The effect of the discovery of non-Euclidean geometry on recent evolution of mathematics	214
9. The formation and development of the concept of mathematical space	214
10. Axiomatic method and modern mathematics	218

Supplement

220
