

PREFACE	ix
I. BACKGROUND IN TOPOLOGY	1
1. Extension and embedding properties	1
2. Homotopical properties of spaces	10
3. Approximative and proximative retracts	19
4. Hyperspaces of metric spaces	22
5. The Čech homology (cohomology) functor	28
6. Maps of spaces of finite type	35
7. The Čech homology functor with compact carriers	36
8. Vietoris maps	38
9. Homology of open subsets of Euclidean spaces	42
10. The (ordinary) Lefschetz number	46
11. The generalized Lefschetz number	49
12. The coincidence problem	53
II. MULTIVALUED MAPPINGS	61
13. General properties	61
14. Upper semicontinuous mappings	67
15. Lower semicontinuous mappings	71
16. Michael's selection theorem	74
17. $\sigma$ -Selectable mappings	77
18. Directionally continuous selections	81
19. Measurable selections	85
20. Borsuk and Hausdorff continuity of multivalued mappings	93
21. Banach contraction principle for multivalued maps	96
III. APPROXIMATION METHODS IN FIXED POINT THEORY OF MULTIVALUED MAPPINGS	105
22. Graph-approximation	105
23. Existence of approximations	110
24. Homotopy	117
25. The fixed point index in $A(X)$	120
26. Topological degree in $R^n$	122
27. Topological degree for mappings with non-compact values in $R^n$	130
28. Topological degree in normed spaces	143
29. Topological degree of vector fields with non-compact values in Banach spaces	147
30. Topological essentiality	152
31. Random fixed points	155
IV. HOMOLOGICAL METHODS IN FIXED POINT THEORY OF MULTIVALUED MAPPINGS	159
32. Acyclic mappings	159
33. Strongly acyclic maps	163
34. The fixed point index for acyclic maps of Euclidean Neighbourhood Retracts	166
35. The Nielsen number	173
36. $n$ -Acyclic mappings	182

37. Theorem on antipodes for $n$ -acyclic mappings	187
38. Theorem on invariance of domain	193
39. $n$ -Acyclic compact vector fields in normed spaces	196
40. Admissible mappings	199
41. The Lefschetz fixed point theorem for admissible mappings	203
42. The Lefschetz fixed point theorem for noncompact admissible mappings	207
43. $n$ -Admissible mappings	211
44. Category of morphisms	224
45. The Lefschetz fixed point theorem for morphisms	231
46. Homotopical classification theorems for morphisms	232
47. The fixed point index for morphisms	235
48. Noncompact morphisms	242
49. $n$ -Morphisms	246
50. Multivalued maps with nonconnected values	247
51. A fixed point index of decompositions for finite polyhedra	262
52. Fixed point index of decompositions for compact ANRs	267
53. Fixed point index of decompositions for arbitrary ANRs	274
54. Spheric mappings	276
V. CONSEQUENCES AND APPLICATIONS	281
55. Birkhoff–Kellog, Rothe and Poincaré theorems	281
56. Fixed point property and families of multivalued mappings	285
57. The Lefschetz fixed point theorem for pairs of spaces	289
58. Repulsive and ejective fixed points	291
59. Condensing and $k$ -set contraction mappings	296
60. Compacting mappings	302
61. Fixed points of differentiable multivalued maps	304
62. The generalized topological degree for acyclic mappings	312
63. The bifurcation index	317
64. Multivalued dynamical systems	322
65. Minimax theorems for ANR-s	331
66. KKM-mappings	338
67. Topological dimension of the set of fixed points	343
68. On the basis problem in normed spaces	345
VI. FIXED POINT THEORY APPROACH TO DIFFERENTIAL INCLUSIONS	347
69. Aronszajn type results	347
70. Solution sets for differential inclusions	352
71. The l.s.c. case	359
72. Periodic solutions for differential inclusions in $R^n$	363
73. Differential inclusions on proximate retracts	369
74. Implicit differential inclusions	373
75. Concluding remarks and comments	378
VII. REFERENCES	381
VIII. INDEX	397
