Contents

Preface IX

1 Introduction 1
1.1 The Riemann Zeta-Function and the Distribution of Prime Numbers 1
1.2 Bohr's Probabilistic Approach 9
1.3 Voronin's Universality Theorem 12
1.4 Dirichlet L-Functions and Joint Universality 19
1.5 L-Functions Associated with Newforms 24
1.6 The Linnik–Ibragimov Conjecture 28

2 Dirichlet Series and Polynomial Euler Products 35
2.1 General Theory of Dirichlet Series 35
2.2 A Class of Dirichlet Series: The Main Actors 37
2.3 Estimates for the Dirichlet Series Coefficients 40
2.4 The Mean-Square on Vertical Lines 43

3 Interlude: Results from Probability Theory 49
3.1 Weak Convergence of Probability Measures 49
3.2 Random Elements 52
3.3 Denjoy's Probabilistic Argument for Riemann's Hypothesis 54
3.4 Characteristic Functions and Fourier Transforms 56
3.5 Haar Measure and Characters 57
3.6 Random Processes and Ergodic Theory 58
3.7 The Space of Analytic Functions 59

4 Limit Theorems 63
4.1 Associated Random Elements and the Main Limit Theorem 63
4.2 Limit Theorems for Dirichlet Polynomials 67
4.3 An Ergodic Process 70
4.4 Approximation in the Mean 73

4.5 A Limit Theorem for Absolutely Convergent Series 76
4.6 Proof of the Main Limit Theorem 80
4.7 Generalizations 83
4.8 A Discrete Limit Theorem 84

5 Universality 87
5.1 Dense Sets in Hilbert Spaces 87
5.2 Application to the Space of Analytic Functions 94
5.3 Entire Functions of Exponential Type 96
5.4 The Positive-Density Method 98
5.5 The Support of the Limit Measure 105
5.6 The Universality Theorem 106
5.7 Discrete Universality 109

6 The Selberg Class 111
6.1 Definition and First Properties 111
6.2 Primitive Functions and the Selberg Conjectures 116
6.3 Non-Vanishing and Prime Number Theorems 119
6.4 Pair Correlation 122
6.5 The Phragmén–Lindelöf Principle 124
6.6 Universality in the Selberg Class 128
6.7 Lindelöf's Hypothesis 130
6.8 Symmetric Power L-Functions 133

7 Value-Distribution in the Complex Plane 137
7.1 Sums Over c-Values 137
7.2 Riemann–von Mangoldt-Type Formulae 142
7.3 Nevanlinna Theory 147
7.4 Uniqueness Theorems 151

8 The Riemann Hypothesis 155
8.1 Uniform Approximation and Zeros 155
8.2 Bagchi's Theorem 156
8.3 A Generalization 160
8.4 An Approach Towards Riemann's Hypothesis? 162
8.5 Further Equivalents of the Riemann Hypothesis 163

9 Effective Results 167
9.1 The Problem of Effectivity 167
9.2 Upper Bounds for the Density of Universality 169
9.3 Value-Distribution on Arithmetic Progressions 174
9.4 Making Universality Visible 176
9.5 Almost Periodicity in the Half-Plane of Absolute Convergence 178
9.6 Effective Inhomogeneous Diophantine Approximation 182
9.7 c-Values Revisited 188

10 Consequences of Universality 193
10.1 Dense Sets in the Complex Plane 193
10.2 Functional Independence 195
10.3 Joint Functional Independence 198
10.4 Andersson's Disproof of a Mean-Square Conjecture 200
10.5 Voronin's Theorems and Physics 201
10.6 Shifts of Universal Dirichlet Series 202

11 Dirichlet Series with Periodic Coefficients 209
11.1 Zero-Distribution 209
11.2 A Link to the Selberg Class 216
11.3 Strong Universality 219
11.4 Hurwitz Zeta-Functions 223

12 Joint Universality 229
12.1 A Joint Limit Theorem 229
12.2 A Transfer Theorem 234
12.3 Twisted L-Functions 238
12.4 First Applications 245
12.5 A Conjecture 246

13 L-Functions of Number Fields 249
13.1 Dedekind Zeta-Functions 249
13.2 Grössencharacters 256
13.3 Hecke L-Functions 258
13.4 Universality for Hecke L-Functions 260
13.5 Artin's Reciprocity Law 261
13.6 Artin L-Functions 263
13.7 The Artin Conjecture 269
13.8 Joint Universality for Artin L-Functions 274
13.9 L-Functions to Automorphic Representations 278

A Appendix: A Short History of Universality 285
