Preface	xi
Introduction	xiii
1 The main theorems	1
1.1 Homotopy	1
1.2 Functors	2
1.3 Suspension	4
1.4 Self-maps and the nilpotence theorem	6
1.5 Morava K-theories and the periodicity theorem	6
2 Homotopy groups and the chromatic filtration	11
2.1 The definition of homotopy groups	11
2.2 Classical theorems	12
2.3 Cofibres	14
2.4 Motivating examples	16
2.5 The chromatic filtration	20
3 MU-theory and formal group laws	25
3.1 Complex bordism	25
3.2 Formal group laws	26
3.3 The category \mathbf{CF}	29
3.4 Thick subcategories	33
4 Morava's orbit picture and Morava stabilizer groups	37
4.1 The action of Γ on L	37
4.2 Morava stabilizer groups	39
4.3 Cohomological properties of S_n	41
5 The thick subcategory theorem	45
5.1 Spectra	45
5.2 Spanier-Whitehead duality	48

5.3	The proof of the thick subcategory theorem	51
6	The periodicity theorem	53
6.1	Properties of v_n -maps	54
6.2	The Steenrod algebra and Margolis homology groups	58
6.3	The Adams spectral sequence and the v_n -map on Y	61
6.4	The Smith construction	67
7	Bousfield localization and equivalence	69
7.1	Basic definitions and examples	69
7.2	Bousfield equivalence	72
7.3	The structure of $\langle MU \rangle$	75
7.4	Some classes bigger than $\langle MU \rangle$	76
7.5	$E(n)$ -localization and the chromatic filtration	77
8	The proofs of the localization, smash product and chromatic convergence theorems	81
8.1	L_nBP and the localization theorem	82
8.2	Reducing the smash product theorem to a special example	84
8.3	Constructing a finite torsion free prenilpotent spectrum	86
8.4	Some cohomological properties of profinite groups	90
8.5	The action of S_m on $FK(m)_*(\mathbb{C}P^\infty)$	92
8.6	Chromatic convergence	95
9	The proof of the nilpotence theorem	99
9.1	The spectra $X(n)$	100
9.2	The proofs of the first two lemmas	102
9.3	A paradigm for proving the third lemma	106
9.4	The Snaith splitting of $\Omega^2 S^{2m+1}$	108
9.5	The proof of the third lemma	111
9.6	Historical note: theorems of Nishida and Toda	115
A	Some tools from homotopy theory	119
A.1	CW-complexes	119
A.2	Loop spaces and spectra	122
A.3	Generalized homology and cohomology theories	126
A.4	Brown representability	130
A.5	Limits in the stable homotopy category	131
A.6	The Adams spectral sequence	138

B	Complex bordism and BP-theory	145
B.1	Vector bundles and Thom spectra	145
B.2	The Pontrjagin-Thom construction	152
B.3	Hopf algebroids	154
B.4	The structure of $MU_*(MU)$	159
B.5	BP -theory	166
B.6	The Landweber exact functor theorem	172
B.7	Morava K-theories	175
B.8	The change-of-rings isomorphism and the chromatic spectral sequence	178
C	Some idempotents associated with the symmetric group	183
C.1	Constructing the idempotents	183
C.2	Idempotents for graded vector spaces	187
C.3	Getting strongly type n spectra from partially type n spectra	190
	Bibliography	195
	Index	205
