Contents

Preface v

Chapter I: Basic Concepts 1

§ 1 Equations for oscillatory systems 1
1.1 First order systems. 1
1.2 Linear periodic systems 2
1.3 Higher order systems 4

§ 2 The shift operator and first return function 8
2.1 Shift operator 8
2.2 Periodic solutions of autonomous systems 9

§ 3 Integral and integrofunctional operators for periodic problem 11
3.1 Completely continuous operators 11
3.2 Spaces of functions 12
3.3 Linear integral operators and their properties 13
3.4 A superposition operator 13
3.5 The Hammerstein operator 14
3.6 Integral and integrofunctional equations 14
3.7 The Fréchet derivative 16
3.8 Periodic problem for systems of automatic control 17

§ 4 The harmonic balance method 20
4.1 Forced oscillations 20
4.2 Free oscillations 20
4.3 Oscillations in the systems of automatic control 21
4.4 Harmonic balance method and general theory of projection methods 22

§ 5 The method of mechanical quadratures 25
5.1 The Galerkin method with perturbations 25
5.2 Quadrature processes 26
5.3 The method of mechanical quadratures in looking for periodic solutions 27

§ 6 The collocation method 29
6.1 The operator scheme of the collocation method 29
6.2 The collocation method in approximation of oscillatory regimes . 31
6.3 On choice of interpolation nodes 32

§ 7 The method of finite differences 33
7.1 Formulae of numeric differentiation 33
7.2 Discretization of the differential equations 33
7.3 Reduction of the method of finite differences to the Galerkin method 34

§ 8 Factor methods 37
8.1 Discrete convergence 37
8.2 Discrete compactness 38
8.3 Discrete convergent sequences of operators 38
8.4 The method of mechanical quadratures 39
8.5 The method of finite differences 40

Chapter II: Existence theorems for oscillatory regimes 43

§ 1 Smooth manifolds and differential forms 43
1.1 Smooth manifolds 43
1.2 Tangent spaces 44
1.3 Orientation 46
1.4 Manifolds with boundaries 46
1.5 Exterior forms 47
1.6 Outer product 47
1.7 Differential forms 48
1.8 Integration of differential forms 49
1.9 Outer differentiation 51

§ 2 Degree of a mapping 51
2.1 The Sard theorem 52
2.2 Lemmas about one-dimensional manifolds 52
2.3 The degree of a mapping 53
2.4 The degree of a mapping (the second approach) 57
2.5 Relation between two definitions of the degree of a mapping . . 60
2.6 Properties of the degree of a mapping 61
2.7 The degree of continuous mappings 64

§ 3 Rotation of vector fields 65
3.1 Vector fields 65
3.2 Homotope fields. Criteria of homotopy 65
3.3 Rotation of a vector field 66
3.4 Properties of the rotation 66

§ 4 Completely continuous vector fields 73
4.1 Finite-dimensional approximations 73
4.2 Soundness of the definition of the rotation 75
4.3 Properties of the rotation 77

§ 5 Fixed point principles and solution of operator equations 80
5.1 The Brouwer theorem 80
5.2 The Browder theorem 81
5.3 The Schauder theorem 86
5.4 The Leray–Schauder principle 87
5.5 The contraction mapping principle 88
5.6 Operator equations in products of Banach spaces 90

§ 6 Forced oscillations in systems with weak nonlinearities 94
6.1 Systems with bounded nonlinearities 94
6.2 Systems of automatic control 95

§ 7 Oscillations in systems with strong nonlinearities. Directing functions method 98
7.1 Points of T-irreversibility 98
7.2 Directing functions 100
7.3 The full system of directing functions 103
7.4 Regular directing functions 105
7.5 Construction of directing functions 105

Chapter III: Convergence of numerical procedures 107

§ 1 Projection methods 107
1.1 The Galerkin method procedure 107
1.2 The nondegenerate case 107
1.3 Topological principle of convergence of the Galerkin method . . 111
1.4 Convergence of the Galerkin method with perturbations 113
1.5 Projection procedures in the Hilbert space 115
1.6 Estimates of the convergence rate 117

§ 2 Factor methods 119
2.1 Regular and compact convergence 119
2.2 The a posteriori estimate lemma 119
2.3 The convergence of the factor method (the nondegenerate case) . 121
2.4 The topological principle of convergence of the factor method . . 124
2.5 Convergence of the factor method for equations with a linear main part 129
2.6 Additional remarks 130

§ 3 Convergence of the harmonic balance method and the collocation method in the problem of periodic oscillations 148
3.1 Local convergence of the harmonic balance method 148
3.2 The topological principle of convergence 153
3.3 Convergence of the harmonic balance method in the case of nondifferentiable nonlinearities 154

3.4 Convergence of the harmonic balance method in the problem of forced oscillations of the systems of automatic control 156
3.5 Local convergence of the collocation method 158
3.6 A global convergence of the collocation method 162
3.7 The harmonic balance and the collocation methods for periodic oscillations of multi-circuit systems of automatic control 164
3.8 The feasibility of the harmonic balance and the collocation methods 167

§ 4 Convergence of the method of mechanical quadratures 171
4.1 Convergent quadrature processes 171
4.2 Local convergence of the method of mechanical quadratures . . 174
4.3 The global convergence of the method of mechanical quadratures 179
4.4 Convergence of the method of mechanical quadratures for general nonlinear systems 181

§ 5 Convergence of the method of finite differences 188
5.1 Convergent formulae of numeric differentiation 188
5.2 Discretization of differential equations 190
5.3 Network spaces and connecting mappings 191
5.4 A convergence theorem for differentiable nonlinearities 192
5.5 Auxiliary statements 192
5.6 Proof of Theorem 5.1 194
5.7 The topological principle of convergence 197
5.8 Additional remarks 198

§ 6 Numerical procedures of approximate construction of oscillatory regimes in autonomous systems 198
6.1 Specific features of the problem 198
6.2 The method of the functional parameter 199
6.3 The method of additional constraints 201
6.4 The degeneracy dimension 205
6.5 The convergence theorem 205
6.6 The harmonic balance method in search for oscillations of autonomous systems of automatic control 208
6.7 The functional characteristic 213
6.8 The topological principle of convergence 214
6.9 Additional remarks 215

§ 7 Affinity theory 215
7.1 Formulation of the problem 215
7.2 Domains with the same core 217
7.3 An affinity theorem for nonautonomous systems 217
7.4 The affinity theorem for nonautonomous systems of automatic control 220
7.5 Autonomous systems. The topological index of a cycle 223

7.6 Affinity theorem for autonomous systems of automatic control . . 224
7.7 Additional remarks 232

§ 8 Effective convergence criteria for numerical procedures 235
8.1 Use of affinity theory for proving the convergence of numerical procedures 235
8.2 The directing functions method and convergence of numerical procedures 235
8.3 Stability of oscillatory regimes and convergence of numerical procedures 237

§ 9 Effective estimates of the convergence rate for the harmonic balance method 240
9.1 A posteriori error estimates 240
9.2 Quasi-linear systems 241
9.3 Systems of automatic control 245
9.4 Stability analysis for the periodic solution 248
