TABLE OF CONTENTS

CHAPTER PAGE

I. FOURIER SERIES

1. Definition of Fourier series 1
2. Orthogonality of sines and cosines 2
3. Determination of the coefficients 3
4. Series of cosines and series of sines 6
5. Examples 8
6. Magnitude of coefficients under special hypotheses . 11
7. Riemann's theorem on limit of general coefficient . 14
8. Evaluation of a sum of cosines 17
9. Integral formula for partial sum of Fourier series . 17
10. Convergence at a point of continuity 18
11. Uniform convergence under special hypotheses . . 21
12. Convergence at a point of discontinuity 22
13. Sufficiency of conditions relating to a restricted neighborhood 24
14. Weierstrass's theorem on trigonometric approximation 25
15. Least-square property 27
16. Parseval's theorem 29
17. Summation of series 31
18. Fejér's theorem for a continuous function . . . 32
19. Proof of Weierstrass's theorem by means of de la Vallée Poussin's integral 35
20. The Lebesgue constants 40
21. Proof of uniform convergence by the method of Lebesgue 42

II. LEGENDRE POLYNOMIALS

1. Preliminary orientation 45
2. Definition of the Legendre polynomials by means of the generating function 45
3. Recurrence formula 46
4. Differential equation and related formulas . . . 48
5. Orthogonality 50

CHAPTER PAGE

6. Normalizing factor 51
7. Expansion of an arbitrary function in series . . 53
8. Christoffel's identity 54
9. Solution of the differential equation 55
10. Rodrigues's formula 57
11. Integral representation 58
12. Bounds of $P_n(x)$ 61
13. Convergence at a point of continuity interior to the interval 63
14. Convergence at a point of discontinuity interior to the interval 65

III. BESSEL FUNCTIONS

1. Preliminary orientation 69
2. Definition of $J_0(x)$ 69
3. Orthogonality 71
4. Integral representation of $J_0(x)$ 74
5. Zeros of $J_0(x)$ and related functions 76
6. Expansion of an arbitrary function in series . . 79
7. Definition of $J_n(x)$ 80
8. Orthogonality: developments in series 82
9. Integral representation of $J_n(x)$ 84
10. Recurrence formulas 85
11. Zeros 87
12. Asymptotic formula 87
13. Orthogonal functions arising from linear boundary value problems 88

IV. BOUNDARY VALUE PROBLEMS

1. Fourier series: Laplace's equation in an infinite strip 91
2. Fourier series: Laplace's equation in a rectangle . 95
3. Fourier series: vibrating string 96
4. Fourier series: damped vibrating string 100
5. Polar coordinates in the plane 101
6. Fourier series: Laplace's equation in a circle; Poisson's integral 103
7. Transformation of Laplace's equation in three dimensions 105
8. Legendre series: Laplace's equation in a sphere . 107

CHAPTER PAGE

9. Bessel series: Laplace's equation in a cylinder . . 109
10. Bessel series: circular drumhead 112

V. DOUBLE SERIES; LAPLACE SERIES

1. Boundary value problem in a cube; double Fourier series 115
2. General spherical harmonics 118
3. Laplace series 121
4. Harmonic polynomials 126
5. Rotation of axes 129
6. Integral representation for group of terms in the Laplace series 132
7. Completeness of the Laplace series 137
8. Boundary value problem in a cylinder; series involving Bessel functions of positive order 138

VI. THE PEARSON FREQUENCY FUNCTIONS

1. The Pearson differential equation 142
2. Quadratic denominator, real roots 142
3. Quadratic denominator, complex roots 145
4. Linear or constant denominator 146
5. Finiteness of moments 147

VII. ORTHOGONAL POLYNOMIALS

1. Weight function 149
2. Schmidt's process 151
3. Orthogonal polynomials corresponding to an arbitrary weight function 153
4. Development of an arbitrary function in series . . 155
5. Formula of recurrence 156
6. Christoffel-Darboux identity 157
7. Symmetry 158
8. Zeros 159
9. Least-square property 160
10. Differential equation 161

VIII. JACOBI POLYNOMIALS

1. Derivative definition 166
2. Orthogonality 167
3. Leading coefficients 169

CHAPTER PAGE

4. Normalizing factor; series of Jacobi polynomials . 171
5. Recurrence formula 172
6. Differential equation 173

IX. HERMITE POLYNOMIALS

1. Derivative definition 176
2. Orthogonality and normalizing factor 177
3. Hermite and Gram-Charlier series 178
4. Recurrence formulas; differential equation . . . 179
5. Generating function 181
6. Wave equation of the linear oscillator 181

X. LAGUERRE POLYNOMIALS

1. Derivative definition 184
2. Orthogonality; normalizing factor; Laguerre series . 184
3. Differential equation and recurrence formulas . . 186
4. Generating function 187
5. Wave equation of the hydrogen atom 188

XI. CONVERGENCE

1. Scope of the discussion 191
2. Magnitude of the coefficients; first hypothesis . . 192
3. Convergence; first hypothesis 194
4. Magnitude of the coefficients; second hypothesis . 197
5. Convergence; second hypothesis 199
6. Special Jacobi polynomials 200
7. Multiplication or division of the weight function by a polynomial 201
8. Korous's theorem on bounds of orthonormal polynomials 205

EXERCISES 209

BIBLIOGRAPHY 229

INDEX. 231
