

CONTENTS

INTRODUCTION	3
CHAPTER 1 DERIVATION OF THE FUNDAMENTAL EQUATIONS OF MATHEMATICAL PHYSICS	5
1 Vibrations of a string	5
2 Oscillations of a membrane	9
3 Equations of hydrodynamics and the propagation of sound waves	12
4 Heat transfer equation for an isotropic solid	19
5 Problems which may be reduced to the Laplace equation.	24
CHAPTER 2 CLASSIFICATION OF SECOND ORDER EQUATIONS .	27
6 Types of second order equations	27
7 Reduction of second order equations with constant coefficients to the canonical form	28
8 Reduction of second order equations with two inde- pendent variables to the canonical form	31
CHAPTER 3 EQUATIONS OF THE HYPERBOLIC TYPE.	40
9 Oscillations of a string: d'Alembert's solution	40
10 Hyperbolic equation with two independent variables	50
11 The wave equation	57
12 Cauchy's problem: characteristics	71
13 The mixed problem	77
14 Fourier's method	82
CHAPTER 4 EQUATIONS OF THE PARABOLIC TYPE	111
15 First boundary value problem. Extremal theorem . .	111
16 Cauchy's problem.	120

CHAPTER 5	EQUATIONS OF THE ELLIPTIC TYPE	132
17	Laplace equation	132
18	Green's formula	133
19	Basic properties and harmonic functions	137
20	Formulation of basic problems for the Laplace equation.	140
21	Green's function for the Laplace operator	142
22	Solution of the internal Dirichlet problem for a sphere	145
23	Continuity theorems for harmonic functions	152
24	The external Dirichlet problem for a sphere	154
25	Behaviour of arbitrary harmonic functions at infinity	155
26	Uniqueness theorem for Neuman's problem	157
CHAPTER 6	POTENTIAL THEORY	160
27	Potentials due to volume distribution and to single and double layers	160
28	Improper integrals depending on a parameter	163
29	Potential due to volume distribution	165
30	Lyapunov's surfaces	174
31	Potential due to a double layer	177
32	Potential due to a simple layer	186
