Preface	v
Introduction	1
CHAPTER I. Physical Formulations Leading to Ill-posed Problems	7
1. Continuation of static fields	7
2. Problems for the diffusion equation	10
3. Continuation of fields from discrete sets	11
4. Processing readings of physical instruments	13
5. Inverse problems of geophysics	15
6. Inverse problems of gravimetry	16
7. The inverse kinematic problem of seismology	19
CHAPTER II. Basic Concepts of the Theory of Ill-posed Problems	26
1. Problems well-posed in the Tikhonov sense	26
2. Regularization	32
3. Linear ill-posed problems	39
CHAPTER III. Analytic Continuation	48
1. Formulations of problems and classical results	48
2. Analytic continuation from continua	52
3. Analytic continuation from classes of sets including discrete sets	57
4. Recovery of solutions of elliptic and parabolic equations from their values on sets lying inside the domain of regularity	63
CHAPTER IV. Boundary Value Problems for Differential Equations	72
1. The noncharacteristic Cauchy problem for a parabolic equation. The Cauchy problem for an elliptic equation	73
2. A mixed problem for a parabolic equation with decreasing time	95
3. Cauchy problems with data on a segment of the time axis for degenerate parabolic and pseudoparabolic equations	106

4. Cauchy problems with data on a timelike surface for hyperbolic and ultrahyperbolic equations	123
CHAPTER V. Volterra Equations	155
1. Regularization of a Volterra equation of the first kind	155
2. Operator Volterra equations of the first kind	159
CHAPTER VI. Integral Geometry	168
1. The problem of finding a function from its spherical means	170
2. Problems of integral geometry on a family of manifolds which is invariant under a group of transformations of the space	175
3. Integral geometry in special classes of functions	183
4. Integral geometry "in the small"	190
5. The problem of integral geometry in plane curves and energy inequalities	202
CHAPTER VII. Multidimensional Inverse Problems for Linear Differential Equations	209
1. Examples of formulations of multidimensional inverse problems. Mathematical problems connected with investigating them	211
2. A general approach to investigating questions of uniqueness and stability of inverse problems	220
3. Inverse problems for hyperbolic equations of second order	227
4. Inverse problems for first-order hyperbolic systems	234
5. Inverse problems for parabolic equations of second order	251
1. The connection between solutions of direct problems for equations of hyperbolic and parabolic types and inverse problems	251
2. The method of descent in inverse problems	252
3. Inverse problems for equations of parabolic type	254
6. An abstract inverse problem and questions of its being well-posed	255
1. Reduction to the investigation of a two-parameter family of linear equations	257
2. The method of linearization in investigating the inverse problem	261
Bibliography	265
