A	Solvability Properties of Riemann Hilbert Problems	
1	Review of the Riemann–Hilbert–Problem in Hilbert’s Normal Form	3
	1.1 The First Boundary Value Problem	4
	1.2 The Boundary Value Problem with Characteristic ≤ 0	13
	1.3 The Boundary Value Problem of Positive Characteristic	24
	1.4 Semilinear First-Order Problems	31
	1.5 Remarks on the Additional References	36
	References	36
2	The Normal Form of Elliptic Systems with Two Unknowns	39
	2.1 The Distinguishing Pfaffian Form of (2.0.1)	40
	2.2 The Transformation Using Complex-Valued Functions	43
	2.3 The Solution of Beltrami’s System in the Analytic Case	47
	2.4 Existence Proofs with the Hilbert Transformation	52
	2.5 <i>A priori</i> Estimates	63
	2.6 Nonlinear Elliptic Systems	65
	References	73
3	Normal Forms of General First-Order Systems	75
	3.1 Classification and the Algebraic Normal Forms for Elliptic Systems	76
	3.2 The Fredholm Property for Systems in Normal Form	82
	3.3 The Index for Systems in Normal Form	96
	3.4 One Adjoint System and Normal Solvability	98
	3.5 Two Problems with Violated Lopatinski Condition	101
	References	107

4	The General Regular Elliptic Boundary Value Problem	109
4.1	<i>A priori</i> Estimate and Semi-Fredholm Property	110
4.2	The Fredholm Property of the General System and its Approximation	118
4.3	The Adjoint Problem	124
4.4	Some Remarks on Nonlinear Systems	129
4.5	Remarks on the Additional References	139
	References	140
5	Singular Integral Equations, Representation Formulas and some Function Theoretic Properties	147
5.1	Singular Integral Equations for Systems in Normal Form	149
5.2	Fundamental Solutions and Singular Integral Equations	164
5.3	Generalized Hyperanalytic Functions, Zeros, Unique Continuation and the Runge Property	187
5.4	Remarks on the Analytic Theory	195
5.5	Remarks on the Additional References	213
	References	214
B	Computational Methods	
6	Numerical Methods Using Integral Equations	223
6.1	Conformal Mapping	224
6.2	Boundary Integrals	238
6.3	The Approximation and Discretization of Fredholm Integral Equations of the Second Kind	240
6.4	A Successive Approximation Method	253
6.5	Layer Methods	256
6.6	Remarks on the Additional References	275
	References	275
7	Finite Difference Methods	281
7.1	Matrices of Positive Type	284
7.2	The Approximation Scheme for the Laplacian	286
7.3	The Discrete Green Function	287
7.4	The Discrete and Nondiscrete Green Functions	294
7.5	An $O(h^2)$ Approximation for the Discrete Neumann Function	303
7.6	The Discrete and the Nondiscrete Neumann Functions	312
7.7	Remarks on the Normalizing Condition	321
7.8	A Convergent Finite Difference Method for the First-Order System	324

7.9	Remarks on the Treatment of the Difference Equations	333
7.10	Remarks on Semilinear Problems	335
	References	337
8	Continuous Approximations by Minimizing the Defect	341
8.1	Chebyshev Approximations	343
8.2	Least Squares Approximations without Weighted Norms	346
8.3	Finite Element Approximations	348
8.4	A Least Squares Method with Optimal Order of Convergence	352
8.5	The Discrete Equations for the Least Squares Method	358
8.6	A Ritz and a Galerkin Method for the Standard Problem (1.1.1)	366
8.7	Remarks on the Additional References	379
	References	379
	Appendix Applications of Systems of the First Order	385
A.1	One Second Order Equation	386
A.2	Plane Elastic Deformations	386
A.3	Plate and Shell Problems	389
A.4	Flow Problems	392
	References	394
	Index	399
