## Part A

### Boundary Value Problems for Partial Differential Equations of Elliptic Type

#### CHAPTER I: THEORY OF HEAT CONDUCTION

1. The differential equation of heat transfer . . . . .	1
2. The special case of steady flow . . . . .	3
3. Point sources and fundamental singularities . . . . .	7
4. Fundamental solutions . . . . .	10
5. Discontinuities . . . . .	15
6. Dirichlet's principle . . . . .	17
7. A modified heat equation . . . . .	20
8. Formal considerations . . . . .	22

#### CHAPTER II: FLUID DYNAMICS

1. The fundamental equations . . . . .	25
2. Stationary irrotational flow . . . . .	28
3. Incompressible, irrotational, stationary fluid flow . . . . .	30
4. Sources and sinks . . . . .	32
5. Fundamental solutions and flow patterns . . . . .	35
6. Infinite domains . . . . .	38
7. Virtual mass . . . . .	43
8. Dirichlet identities . . . . .	46
9. Virtual mass as an extremum . . . . .	55
10. Variational formulas . . . . .	58
11. Free boundaries, discontinuity surfaces, and virtual mass . . . . .	64
12. Two-dimensional flows . . . . .	71
13. Boundary value problems and fundamental solutions in plane flows . . . . .	76
14. Obstacles in a plane flow . . . . .	82
15. The variation of the Green's function . . . . .	93
16. Lavrentieff's extremum problem for lift . . . . .	98
17. Free boundaries in plane flow . . . . .	101
18. The complex kernel function and its applications . . . . .	109
19. Axially symmetric motion of an incompressible fluid . . . . .	119
20. Associated partial differential equations . . . . .	124
21. Two-dimensional compressible fluid flow . . . . .	128
22. Construction of solutions of the differential equations in the hodograph plane . . . . .	133
23. The hodograph method and boundary value problems in the physical plane . . . . .	141
24. Singularities in the hodograph plane and their application . . . . .	147

	Page
<b>CHAPTER III. ELECTRO- AND MAGNETOSTATICS</b>	
1. The general equations of the electrostatic field . . . . .	155
2. Conductor potentials and induction coefficients . . . . .	157
3. The energy of the electrostatic field . . . . .	160
4. The magnetostatic field . . . . .	165
5. The conductor potential; spherical harmonics . . . . .	178
6. Polarization of a conducting surface . . . . .	188
7. Forces and moments in a conductor surface . . . . .	193
8. Orthogonal harmonic functions . . . . .	198
<b>CHAPTER IV: ELASTICITY</b>	
1. Strain tensor fields . . . . .	206
2. Stress tensor fields . . . . .	209
3. Stress-strain relations . . . . .	211
4. The energy integral and boundary value problems . . . . .	215
5. Betti's formula and the fundamental singularity . . . . .	219
6. Fundamental solutions . . . . .	222
7. Construction of the fundamental solutions in terms of orthonormal solution fields . . . . .	226
8. Particular solutions . . . . .	229
9. The theory of thin plates . . . . .	232
10. Fundamental solutions of the biharmonic equation . . . . .	236
11. Plane strain . . . . .	246
<b>Part B</b>	
<b>Kernel Function Methods in the Theory of Boundary Value Problems</b>	
<b>CHAPTER I: PROPERTIES OF SOLUTIONS</b>	
1. Introduction . . . . .	258
2. Notation and definitions . . . . .	259
3. Properties of the solutions of (1.1) . . . . .	261
4. Existence theorems for certain solutions . . . . .	262
5. Fundamental singularities and fundamental solutions . . . . .	268
6. Dirichlet integrals and fundamental functions . . . . .	273
<b>CHAPTER II: THE KERNEL FUNCTIONS AND THEIR PROPERTIES</b>	
1. Kernel functions . . . . .	275
2. Orthonormal systems and construction of the kernel . . . . .	280
3. Integral operators and the construction of complete sets of solutions . . . . .	286
4. Dirichlet identities . . . . .	297
5. Choice of the fundamental singularity . . . . .	301
6. The regularity of $l(P, Q)$ . . . . .	303
7. An integral equation for the kernel . . . . .	309
8. The eigenvalues of the kernel $l(P, Q)$ . . . . .	315
9. Series developments and integral equations . . . . .	326

## CHAPTER III: VARIATIONAL AND COMPARISON THEORY

1. Relations between kernels of different domains . . . . .	335
2. Eigenfunctions of the $\gamma$ -transformation . . . . .	346
3. Doubly orthogonal systems . . . . .	351
4. An application of the operators to the theory of orthogonal functions . . . . .	355
5. Comparison formulas for Green's and Neumann's functions . . . . .	357
6. Variational theory . . . . .	360

## CHAPTER IV: EXISTENCE THEORY

1. Boundary value problem and orthogonal projection . . . . .	371
---	-----

## CHAPTER V: DEPENDENCE OF KERNELS ON BOUNDARY CONDITIONS AND THE DIFFERENTIAL EQUATION

1. The positiveness of the fundamental functions . . . . .	381
2. Stability of fundamental functions . . . . .	384
3. Stability of eigenvalues . . . . .	388
4. Construction of a fundamental singularity . . . . .	392

## CHAPTER VI: GENERALIZATIONS

1. Different types of metrics . . . . .	395
2. Further generalizations . . . . .	402
List of Symbols Used in Part B. . . . .	404
Bibliography Books . . . . .	408
Articles . . . . .	412
Author Index . . . . .	421
Subject Index . . . . .	425
