

# CONTENTS

<b>Preface</b>	v
<b>Chapter 1. Basic Concepts</b>	1
1.1. <i>Sets</i> . The empty set. Union, intersection, and equality of sets. Subsets. 1.2. <i>Plane Point Sets</i> . Circular neighborhood. Open set. Complement of a set. Closed set. Bounded set. Boundary of a set. Bounded plane curve. Simple, closed plane curve. Contour. Connected set. Jordan curve theorem. Simply connected set. Region. Nested squares. Heine-Borel theorem. 1.3. <i>Remarks on Real Functions</i> . Analytic function. Diameter of a set. Distance between sets. Partial derivative. Double integral. 1.4. <i>Ordinary Differential Equations</i> . Solutions of ordinary differential equations. General solution of $\frac{dy}{dx} + ky = 0$ , $\frac{d^2y}{dx^2} + ky = 0$ . 1.5. <i>Remarks on Complex-valued Functions</i> . DeMoivre's theorem. The Euler function. Sequences and series. <i>Exercises</i> .	
<b>Chapter 2. Fourier Series</b>	32
2.1. <i>Trigonometric and Fourier Series</i> . Sectionally continuous functions. Jordan's lemma. Quasi-differentiability. Fourier series representation. 2.2. <i>Half-range Series</i> . Even and odd functions. Periodic extensions. Half-range Fourier cosine series. Half-range Fourier sine series. 2.3. <i>Change of Interval</i> . 2.4. <i>Differentiation of Fourier Series</i> . 2.5. <i>Absolute and Uniform Convergence</i> . The Cauchy-Schwarz inequality. Bessel's inequality. Absolute convergence. Uniform convergence. 2.6. <i>Weierstrass Approximation Theorem</i> . Broken line functions. 2.7. <i>Abel's Test</i> . Uniformly bounded functions. Monotonicity. Abel's test on a closed region. <i>Exercises</i> .	
<b>Chapter 3. Second-order Partial Differential Equations</b>	66
3.1. <i>Partial Differential Equations</i> . Quasi-linear and linear second-order equations. Solutions of partial differential equations. 3.2. <i>The Initial-value Problem</i> . Strip conditions. 3.3. <i>Characteristics</i> . 3.4. <i>Canonical Forms</i> . Hyperbolic, elliptic, and parabolic equations. Affine transformations. Invariance of the discriminant. Canonical forms for hyperbolic, elliptic, and parabolic equations. <i>Exercises</i> .	

<b>Chapter 4. The Wave Equation</b>	89
4.1. <i>The Homogeneous Wave Equation.</i> The general solution. A finite difference analogue.	
4.2. <i>The First Cauchy Problem.</i> The formula of D'Alembert. Uniqueness. The domain of dependence.	
4.3. <i>The Second Cauchy Problem.</i> Extension of the formula of D'Alembert. Uniqueness.	
4.4. <i>The Mixed-type Problem.</i> Uniqueness for class $C^2$ .	
4.5. <i>The Method of Separation of Variables.</i> Series solution of the mixed-type problem. <i>Exercises.</i>	
<b>Chapter 5. The Potential Equation</b>	109
5.1. <i>The Dirichlet Problem.</i> The maximum principle. The minimum principle. Uniqueness of the solution of the Dirichlet problem. Continuous dependence on the boundary function.	
5.2. <i>Poisson's Integral Formula.</i> Formulas for circles of arbitrary radii. Formulas in rectangular coordinates. Formulas in polar coordinates. Equivalent Fourier series.	
5.3. <i>Further Properties of Harmonic Functions.</i> Analyticity of harmonic functions. The mean value property. Harnack's theorem. Uniform bounds on first-order derivatives.	
5.4. <i>On the Dirichlet Problem.</i> Subharmonic and superharmonic functions. Subfunctions and superfunctions. Existence and uniqueness of the solution of the Dirichlet problem.	
5.5. <i>Dirichlet Problems on a Square.</i> Series solution by the method of separation of variables. <i>Exercises.</i>	
<b>Chapter 6. The Heat Equation</b>	145
6.1. <i>The Boundary-value Problem of Type H.</i> The maximum principle. The minimum principle. Uniqueness of the solution. Continuous dependence on the boundary functions.	
6.2. <i>Series Solution of Boundary-value Problems of Type H.</i> <i>Exercises.</i>	
<b>Chapter 7. Approximate Solution of Partial Differential Equations</b>	153
7.1. <i>Lattice Points.</i> Interior lattice points and boundary lattice points.	
7.2. <i>Approximate Solution of the Dirichlet Problem.</i> The Liebmann-Gerschgorin-Collatz procedure.	
7.3. <i>Mathematical Basis of the Liebmann-Gerschgorin-Collatz Procedure.</i> Uniqueness of the approximate solution. Convergence of the approximate solution to the analytical solution.	
7.4. <i>Approximate Methods for Cauchy Problem I, Cauchy Problem II, the Mixed-type Problem, and the Boundary-value Problem of Type H.</i> <i>Exercises.</i>	
<b>Chapter 8. Survey of Other Topics</b>	180
8.1. <i>Other Methods of Solution.</i> Method of transforms. Method of Green's functions.	
8.2. <i>The Cauchy-Kowalewski Theorem.</i>	
8.3. <i>Remarks about Nonlinear Partial Differential Equations.</i>	
<b>Selected Bibliography</b>	187
<b>Index</b>	191
