Preface	xiii
Introduction	1
1 The purpose and subject matter of the book	1
2 The definition and significance of the theory of oscillations and waves. The subject area of its investigations. The history of the creation and development of this theory. The relation between the theory of oscillations and waves and the problems of synergetics	3
Part I BASIC NOTIONS AND DEFINITIONS	7
Chapter 1 Dynamical systems. Phase space. Stochastic and chaotic systems. The number of degrees of freedom	9
1.1 Definition of a dynamical system and its phase space	9
1.2 Classification of dynamical systems. The concept of energy	10
1.3 Integrable and non-integrable systems. Action-angle variables	13
1.4 Systems with slowly time varying parameters. Adiabatic invariants	16
1.5 Dissipative systems. Amplifiers and generators	17
Chapter 2 Hamiltonian systems close to integrable. Appearance of stochastic motions in Hamiltonian systems	19
2.1 The content of the Kolmogorov–Arnold–Moser theory	19
2.2 The Henon–Heiles system	20
Chapter 3 Attractors and repellers. Reconstruction of attractors from an experimental time series. Quantitative characteristics of attractors	22
3.1 Simple and complex attractors and repellers. Stochastic and chaotic attractors	22
3.2 Reconstruction of attractors from an experimental time series	24
3.3 Quantitative characteristics of attractors	25
Chapter 4 Natural and forced oscillations and waves. Self-oscillations and auto-waves	28
4.1 Natural and forced oscillations and waves	28

4.2	Self-oscillations and auto-waves	30
-----	--	----

Part II BASIC DYNAMICAL MODELS OF THE THEORY OF OSCILLATIONS AND WAVES 33

Chapter 5	Conservative systems	35
5.1	Harmonic oscillator	35
5.2	Anharmonic oscillator	36
5.3	The Lotka–Volterra system ('prey–predator' model)	36
5.4	Chains of nonlinear oscillators. The Toda and Fermi–Pasta–Ulam chains	37
5.5	The wave equation. The Klein–Gordon and sine–Gordon equations. The Born–Infeld equation	39
5.6	The equation of simple (Riemann) waves	41
5.7	The Boussinesq and Korteweg–de Vries equations	43
5.8	The Whitham and Rudenko equations	50
5.9	The Khokhlov–Zabolotskaya, cubic Schrödinger, Ginsburg–Landau, and Hirota equations	51
5.10	Some discrete models of conservative systems	56

Chapter 6	Non-conservative Hamiltonian systems and dissipative systems	58
6.1	Non-linear damped oscillator with an external force	58
6.2	The Burgers and Burgers–Korteweg–de Vries equations	59
6.3	The van der Pol, Rayleigh, and Bautin equations	62
6.4	The equations of systems with inertial excitation and inertial non-linearity	62
6.5	The Lorenz, Rössler, and Chua equations	63
6.6	A model of an active string	65
6.7	Models for locally excited media(the equation for a kink wave, the Fitz Hugh–Nagumo and Turing equations)	65
6.8	The Kuramoto–Sivashinsky equation	66
6.9	The Feigenbaum and Zisook maps	67

Part III NATURAL (FREE) OSCILLATIONS AND WAVES IN LINEAR AND NON-LINEAR SYSTEMS 69

Chapter 7	Natural oscillations of non-linear oscillators	71
7.1	Pendulum oscillations	71
7.2	Oscillations described by the Duffing equation	72
7.3	Oscillations of a material point in a force field with the Toda potential	75
7.4	Oscillations of a bubble in fluid	77
7.5	Oscillations of species strength described by the Lotka–Volterra equations	81

7.6	Oscillations in a system with slowly time varying natural frequency	81
Chapter 8	Natural oscillations in systems of coupled oscillators	85
8.1	Linear conservative systems. Normal oscillations	85
8.2	Oscillations in linear homogeneous and periodically inhomogeneous chains	87
8.3	Normal oscillations in non-linear conservative systems	93
8.4	Oscillations in non-linear homogeneous chains	99
8.5	Oscillations of coupled non-linear damped oscillators. Homoclinic structures. A model of acoustic emission	102
Chapter 9	Natural waves in bounded and unbounded continuous media. Solitons	106
9.1	Normally and anomalously dispersive linear waves. Ionization waves in plasmas. Planetary waves in ocean (Rossby waves and solitons)	106
9.2	Non-linear waves described by the Born-Infeld equation. Solitons of the Klein-Gordon and sine-Gordon equations. Interaction between solitons	111
9.3	Simple, saw-tooth and shock waves	116
9.4	Solitons of the Korteweg-de Vries equation	121
9.5	Stationary waves described by the Burgers-Korteweg-de Vries equation	126
9.6	Solitons of the Boussinesq equation	126
9.7	Solitons of the cubic Schrödinger and Ginsburg-Landau equations	127
9.8	Natural waves in slightly inhomogeneous and slightly non-stationary media. The wave action as an adiabatic invariant	129
9.9	Natural waves in periodically stratified media	133
Part IV	FORCED OSCILLATIONS AND WAVES IN PASSIVE SYSTEMS	137
Chapter 10	Oscillations of a non-linear oscillator excited by an external force	139
10.1	Periodically driven non-linear oscillators. The main, subharmonic and superharmonic resonances	139
10.1.1	The main resonance	141
10.1.2	Subharmonic resonances	144
10.1.3	Superharmonic resonances	146
10.2	Chaotic oscillations of non-linear systems under periodic external actions	147
10.2.1	Chaotic oscillations described by the Duffing equation	148
10.2.2	Chaotic oscillations of a gas bubble in liquid under the action of a sound field	149
10.2.3	Chaotic oscillations in the Vallis model for non-linear interaction between ocean and atmosphere	149

10.3 Oscillations excited by external force with a slowly time varying frequency	152
Chapter 11 Oscillations of coupled non-linear oscillators excited by an external periodic force	156
11.1 The main resonance in a system of two coupled harmonically excited non-linear oscillators	156
11.2 Combination resonances in two coupled harmonically driven non-linear oscillators	161
11.3 Driven oscillations in linear homogeneous and periodically inhomogeneous chains caused by a harmonic force applied to the input of the chain	167
11.4 Forced oscillations in non-linear homogeneous and periodically inhomogeneous chains caused by a harmonic force applied to the input of the chain. Excitation of the second harmonic and decay instability	173
11.5 Driven vibration of a string excited by a distributed external harmonic force	184
Chapter 12 Parametric oscillations	186
12.1 Parametrically excited non-linear oscillator	186
12.1.1 Slightly non-linear oscillator with small damping and small harmonic action	186
12.1.2 High frequency parametric action upon a pendulum. Stabilization of the upper equilibrium position as an induced phase transition	189
12.2 Chaotization of a parametrically excited non-linear oscillator. Regular and chaotic oscillations in a model of childhood infections accounting for periodic seasonal change of the contact rate	191
12.3 Parametric resonances in a system of two coupled oscillators	192
12.4 Simultaneous forced and parametric excitation of a linear oscillator. Parametric amplifier	199
Chapter 13 Waves in semibounded media excited by perturbations applied to their boundaries	202
13.1 One-dimensional waves in non-linear homogeneous non-dispersive media. Shock and saw-tooth waves	202
13.2 One-dimensional waves in non-linear homogeneous slightly dispersive media described by the Korteweg–de Vries equation	206
13.3 One-dimensional waves in non-linear highly dispersive media	206
13.4 Non-linear wave bundles in dispersive media	211
13.4.1 Self-focusing and self-defocusing of wave bundles	211
13.4.2 Compression and expansion of pulses in non-linear dispersive media	216
13.5 Non-linear wave bundles in non-dispersive media. Approximate solutions of the Khokhlov–Zabolotskaya equation	218
13.6 Waves in slightly inhomogeneous media	220

13.7 Waves in periodically inhomogeneous media	223
--	-----

Part V OSCILLATIONS AND WAVES IN ACTIVE SYSTEMS. SELF-OSCILLATIONS AND AUTO-WAVES

225

Chapter 14 Forced oscillations and waves in active non-self-oscillatory systems. Turbulence. Burst instability. Excitation of waves with negative energy	227
14.1 Amplifiers with lumped parameters	227
14.2 Continuous semibounded media with convective instability	228
14.3 Excitation of turbulence in non-closed fluid flows. The Klimontovich criterion of motion ordering	229
14.4 One-dimensional waves in active non-linear media. Burst instability .	232
14.5 Waves with negative energy and instability caused by them	235
Chapter 15 Mechanisms of excitation and amplitude limitation of self-oscillations and auto-waves. Classification of self-oscillatory systems	239
15.1 Mechanisms of excitation and amplitude limitation of self-oscillations in the simplest systems. Soft and hard excitation of self-oscillations .	239
15.2 Mechanisms of the excitation of self-oscillations in systems with high frequency power sources	241
15.3 Mechanisms of excitation of self-oscillations in continuous systems. Absolute instability as a mechanism of excitation of auto-waves . . .	242
15.4 Quasi-harmonic and relaxation self-oscillatory systems. Stochastic and chaotic systems	242
15.5 Possible routes for loss of stability of regular motions and the appearance of chaos and stochasticity	243
15.5.1 The Feigenbaum scenario	243
15.5.2 The transition to chaos via fusion of a stable limit cycle with an unstable one and the subsequent disappearance of both of these cycles	244
15.5.3 The transition to chaos via destruction of a two-dimensional torus	244
15.5.4 The Ruelle–Takens scenario	245
Chapter 16 Examples of self-oscillatory systems with lumped parameters. I	246
16.1 Electronic generator. The van der Pol and Rayleigh equations	246
16.2 The Kaidanovsky–Khaikin frictional generator and the Froude pendulum	250
16.3 The Bonhoeffer–van der Pol oscillator	252
16.4 A model of glycolysis and a lumped version of the ‘brusselator’	253
16.5 A lumped model of the Buravtsev oscillator	256

16.6	Clock movement mechanisms and the Neimark pendulum. The energetic criterion of self-oscillation chaotization	259
16.7	Self-oscillatory models for species interaction based on the Lotka–Volterra equations	263
16.8	Systems with inertial non-linearity	264
16.8.1	The Pikovsky model	267
16.9	Systems with inertial excitation	267
16.9.1	The Helmholtz resonator with non-uniformly heated walls	270
16.9.2	A heated wire with a weight at its centre	272
16.9.3	A modified ‘brusselator’	276
16.9.4	Self-oscillations of an air cushioned body	277
Chapter 17 Examples of self-oscillatory systems with lumped parameters. II		283
17.1	The Rössler and Chua systems	283
17.2	A three-dimensional model of an immune reaction illustrating an oscillatory course of some chronic diseases. The ‘oregonator’ model	284
17.3	The simplest model of the economic progress of human society	288
17.4	Models of the vocal source	293
17.5	A lumped model of the ‘singing’ flame	303
Chapter 18 Examples of self-oscillatory systems with high frequency power sources		307
18.1	The Duboshinsky pendulum, a ‘gravitational machine’, and the Andreev hammer	307
18.2	The Bethenod pendulum, the Papaleksi effect, and the Rytov device	313
18.3	Electro-mechanical vibrators. Capacitance sensors of small displacements	317
Chapter 19 Examples of self-oscillatory systems with time delay		322
19.1	Biological controlled systems	322
19.1.1	Models of respiration control	323
19.1.2	The Mackey–Glass model of the process of regeneration of white blood corpuscles (neutrophils)	329
19.1.3	Models of the control of upright human posture	333
19.2	The van der Pol–Duffing generator with additional delayed feedback as a model of Doppler’s autodyne	336
19.3	A ring optical cavity with an external field (the Ikeda system)	339
Chapter 20 Examples of continuous self-oscillatory systems with lumped active elements		341
20.1	The Vitt system. Competition and synchronization of modes	341
20.2	The Rijke phenomenon	348
20.3	A distributed model of the ‘singing’ flame	351

Chapter 21 Examples of self-oscillatory systems with distributed active elements	354
21.1 Lasers. Competition, synchronization and chaotization of modes. Optical auto-solitons	354
21.2 The Gann generators	368
21.3 Ionization waves (striations) in low temperature plasmas	374
21.3.1 Inert gases	378
21.3.2 Molecular gases	381
21.4 A model of the generation of Korotkov's sounds	384
21.5 Self-oscillations of a bounded membrane resulting from excitation of waves with negative energy	393
Chapter 22 Periodic actions on self-oscillatory systems. Synchronization and chaotization of self-oscillations	396
22.1 Synchronization of periodic self-oscillations by an external force in the van der Pol-Duffing generator. Two mechanisms of synchronization. Synchronization as a non-equilibrium phase transition	396
22.2 Synchronization of periodic oscillations in a generator with inertial non-linearity and in more complicated systems	401
22.3 Synchronization of a van der Pol generator with a modulated natural frequency	404
22.4 Asynchronous quenching and asynchronous excitation of periodic self-oscillations	409
22.5 Chaotization of periodic self-oscillations by a periodic external force .	410
22.6 Synchronization of chaotic self-oscillations. The synchronization threshold and its relation to the quantitative characteristics of the attractor	412
Chapter 23 Interaction between self-oscillatory systems	414
23.1 Mutual synchronization of two generators of periodic oscillations . . .	414
23.2 Mutual synchronization of three and more coupled generators of periodic oscillations	421
23.3 Chaotization of self-oscillations in systems of coupled generators . . .	423
23.4 Interaction between generators of periodic and chaotic oscillations . .	424
23.5 Interaction between generators of chaotic oscillations. The notion of synchronization	426
Chapter 24 Examples of auto-waves and dissipative structures	431
24.1 Auto-waves of burning. A model of a kink wave	431
24.2 Auto-waves in the Fitz Hugh-Nagumo model	434
24.3 Auto-waves in a distributed version of the brusselator and in some other models of biological, chemical and ecological systems	436
24.4 Auto-waves described by the Kuramoto-Sivashinsky equation and the generalized Kuramoto-Sivashinsky equation	440

Chapter 25 Convective structures and self-oscillations in fluid. The onset of turbulence	444
25.1 Rayleigh–Taylor instability and the initial stage of the excitation of thermo-convection in a plane layer	444
25.2 Thermo-convection in a toroidal tube. The Lorenz equations	451
25.3 The initial stage of excitation of bio-convection	453
25.4 Onset of turbulence in the flow between two coaxial rotating cylinders. Taylor vortices	456
Chapter 26 Hydrodynamic and acoustic waves in subsonic jet and separated flows	463
26.1 The Kelvin–Helmholtz instability	463
26.2 Subsonic free jets	465
26.3 Sound excitation by an impinging jet. Excitation of edgetones	477
26.4 Self-oscillations in open jet return circuit wind tunnels	481
26.5 The von Karman vortex wake, Aeolian tones and stalling flutter	486
Appendix A Approximate methods for solving linear differential equations with slowly varying parameters	489
A.1 JWKB Method	489
A.2 Asymptotic method	490
A.3 The Liouville–Green transformation	491
A.4 The Langer transformation	492
Appendix B The Whitham method and the stability of periodic running waves for the Klein–Gordon equation	494
Bibliography	499
Index	535
