

Table of Contents

Chapter 0. General motivation	1
Chapter 1. Evolutions and related basic notions	13
1. Evolution operators	13
2. Forced evolution (affine systems)	16
3. Exponentially stable and dichotomic evolutions	19
4. l^2 -forced evolutions	26
5. Liapunov equations	30
6. Uniform controllability. Stabilizability. Uniform observability. Detectability	33
7. Further results concerning exponential stability	41
Notes and References	43
Chapter 2. Nodes	45
1. Linear systems. Input-output operators	45
2. Nodes. Basic operations	49
3. Hankel and Toeplitz operators. The structured stability radius	55
4. Hankel singular values	58
5. All-pass and contracting nodes	60
6. Nehari Problem	66
Notes and References	70
Chapter 3. Riccati equations and nodes	71
1. Popov triplets	71
2. A Popov-Yakubovich type result	78
3. Positivity. Factorizations. Contracting nodes	96
4. Stabilizing compensators. Small Gain Theorem	108
5. l^2 -Optimization	115
6. Reverse-time Riccati equation and contracting nodes	123
7. Extended Nehari problem	138
Notes and References	143
Chapter 4. Disturbance Attenuation	145
1. Problem formulation and basic assumptions	145
2. Statement of necessary solvability conditions: the Kalman-Szegö-Popov-Yakubovich systems.	147
3. The standard Kalman-Szegö-Popov-Yakubovich system	151

4. A game-theoretic Popov-Yakubovich-type result	154
5. Disturbance attenuation. Proof of Theorem 2.2	161
6. A modified system. Proof of Theorem 2.3	165
7. Another modified system	173
8. The γ -attenuator	178
Notes and References	185
Appendix A. Discrete-time stochastic control	187
1. Discrete-time Riccati equation of stochastic control	187
2. Optimal compensator under independent random disturbances	196
Notes and References	204
Appendix B. Almost periodic discrete-time systems	205
1. Standard theory of almost periodic sequences	205
2. A new Bochner theory for almost periodic sequences	209
3. Almost periodic evolution	210
4. Evolutions under Besicovitch sequences	214
Notes and References	219
References	221
Index	225
