Foreword	xiii
by <i>Sir James Lighthill</i>	
Preface	xv
1 Introduction	1
1.1 Historical survey from Newton to Andronov.....	1
1.2 Instabilities of a linear oscillator.....	3
1.3 Non-linear static and dynamic bifurcations	6
1.4 Static bifurcations and catastrophe theory	10
1.5 The fold or limit point	11
1.6 The cusp or symmetric bifurcation.....	14
1.7 The hyperbolic umbilic and hill-top branching	18
1.8 Higher-order catastrophes and structural optimization	22
1.9 Galloping and flutter or suspension bridges.....	24
1.10 Emergence of order in biochemical reactions.....	25
1.11 Non-conservative problems of fluid loading.....	27
1.12 Dynamical systems theory and topological stability.....	32
1.13 Chaos, turbulence, and strange attractors.....	33
1.14 Concluding remarks	33
2 The Buckling of Engineering Structures	35
2.1 Simple experiments on a flexible column	35
2.2 Analysis of a cantilevered link model.....	38
2.3 Large deflection beam formulation.....	40
2.4 Buckling and post-buckling in the first harmonic	43
2.5 A model column with two degrees of freedom.....	46
2.6 Complete harmonic analysis of a strut on a foundation	50
2.7 Symmetric and non-symmetric snap-through of arches	54
2.8 Some distinct and compound branching points.....	57
2.9 Practical problems of strength estimation.....	61
3 Astrophysics and Gravitational Collapse	63
3.1 Collapse of a massive cold star in general relativity.....	63
3.2 Supernovae explosions of cooling stars	69

3.3	Gravothermal catastrophe of hot stellar systems	72
3.4	Core-haloes in globular clusters	75
3.5	Evolution of rotating planetary masses	75
4	Bifurcational Instability of an Atomic Lattice	81
4.1	Symmetry-breaking phenomena	81
4.2	Quantum mechanical and Newtonian foundations	85
4.3	Perturbation theory for hill-top branching	87
4.4	Imperfection sensitivity in crystal fracture	91
4.5	The Lennard-Jones potential for an atomic bond	91
4.6	The close-packed sheet	93
4.7	The four-atom unit cell	96
4.8	Application of the general theory	99
4.9	The three-dimensional lattice	99
4.10	Further work	101
5	Spontaneous Order in Biochemical Reactions and Developmental Biology	103
5.1	The Brusselator model chemical reaction	104
5.2	Creation of spatial order in thermodynamics	108
5.3	Cell differentiation in developmental biology	111
6	Population Dynamics and Evolution of a Prey–Predator Ecology	114
6.1	Lotka–Volterra equations	114
6.2	Stability of the steady state	116
6.3	Numerical solutions by finite differences	118
6.4	An evolution game	121
6.5	Structural stability	125
6.6	Ecological considerations	126
6.7	Current work	126
7	Hydrodynamic Instabilities and the Onset of Turbulence	128
7.1	Flow in a circular pipe	128
7.2	Flow in an annular tube	133
7.3	General hydrodynamic instabilities	136
7.4	Taylor vortices between rotating cylinders	137
8	Chaotic Dynamics of a Strange Attractor	142
8.1	The finite-difference mapping of Hénon	143
8.2	Numerical results and magnification sequences	144
8.3	Sensitivity to initial conditions	151
8.4	Sensitivity to computational round-off errors	151
8.5	Modern work and the chaotic motions of a buckled beam	153

9	Self-excited Oscillations Under Non-conservative	
	Fluid Loading	155
9.1	Aeroelastic galloping of a bluff structure.	156
9.2	Aircraft panel flutter at high supersonic speeds	163
9.3	Static and dynamic instabilities of a pipe conveying fluid	165
9.4	Resonance sensitivity of a dynamic Hopf bifurcation	178
10	Orbital Stability and the attitude Control of Spacecraft	183
10.1	Stability of motion of an orbiting particle	183
10.2	Passive nutation damping of a spinning satellite.	187
11	Dynamical Field Theories for Neural Activity in the Brain	193
11.1	The brain and central nervous system.	193
11.2	Mechanics of excitation and inhibition	194
11.3	Folds and multiple hysteresis in the steady states	195
11.4	Temporal oscillations in a limit cycle	195
11.5	Pattern formation in the space of a neural field.	197
	Appendix: Some Biographies in the History of Stability	198
	References	200
	Index	215
	Index of Bifurcations and Catastrophes	225
