

# CONTENTS

1	INTRODUCTION	1
1.1	Introductory remarks	1
1.2	Modelling of reality	4
1.3	Mathematical formulation and basic definitions	7
1.4	Stability in autonomous systems	12
1.5	Autonomous systems with parameters	23
1.6	Classification of autonomous systems	26
2	POTENTIAL SYSTEMS	35
2.1	Potential function and stability of equilibrium states	35
2.2	Classification of critical conditions	41
2.3	Equilibrium surface via the multiple-parameter perturbation technique	43
2.3.1	Regular (non-critical) equilibrium states	43
2.3.2	General critical points	44
2.4	Simple general points and elementary catastrophes	48
2.4.1	General points of order 2	48
2.4.2	General points of order 3 (singular general point)	52
2.4.3	General points of order 4 and higher order	56
2.5	Two-fold general critical points	57
2.5.1	Equilibrium surface and connection with umbilics	57
2.5.2	Critical zone	60
2.6	Special critical points and imperfection sensitivity	62
2.7	Concluding remarks	77
3	STATIC INSTABILITY OF AUTONOMOUS SYSTEMS	79
3.1	One-parameter systems	79
3.1.1	Simple critical points (divergence)	83
3.1.2	Simple bifurcation points	92
3.1.3	Stability of equilibrium paths in the vicinity of simple bifurcation points	100
3.1.4	Compound branching	106
3.1.5	Imperfection sensitivity of critical points	110
3.2	Multiple-parameter systems	122
3.2.1	Classification of critical points	122
3.2.2	Simple general points of order 2	123
3.2.3	Simple general points of order 3 (singular general points)	135
3.2.4	Compound general points	141

3.2.5 Special critical points	144
3.3 Concluding remarks	154
4 DYNAMIC INSTABILITY OF AUTONOMOUS SYSTEMS	156
4.1 Introductory remarks	156
4.2 Non-linear oscillations and the method of harmonic balancing	157
4.3 An intrinsic method of harmonic analysis	161
4.4 One-parameter systems	167
4.4.1 Hopf bifurcation	167
4.4.2 An illustrative example	179
4.4.3 Flat Hopf bifurcation	182
4.4.4 Symmetric bifurcation (tri-furcation)	183
4.5 Alternative formulation of one-parameter systems	188
4.5.1 Double Hopf bifurcation	192
4.5.2 Cusp bifurcation	196
4.5.3 Tangential bifurcation	200
4.6 Stability of limit cycles	203
4.6.1 Hopf bifurcation	206
4.6.2 Symmetric bifurcation (tri-furcation)	207
4.7 Multiple-parameter systems	208
4.7.1 Generalized Hopf bifurcation No. 1	211
4.7.2 Generalized Hopf bifurcation No. 2	214
4.7.3 Generalized Hopf bifurcation No. 3	218
4.7.4 More generalized bifurcations	219
4.8 Concluding remarks	223
5 APPLICATIONS	225
5.1 Potential systems in mechanics	225
5.1.1 A structural model	225
5.1.2 Columns on elastic foundations	229
5.1.3 Experimental results	232
5.2 Autonomous mechanical and electrical systems	233
5.2.1 A mechanical system	234
5.2.2 Static instability of a non-linear network	237
5.2.3 Hopf bifurcation associated with a non-linear network	239
5.2.4 A mechanical system and its electrical analogue	242
5.3 Thermodynamics: phase transitions	250
5.4 Bio-chemical processes (static instability)	251
5.5 The Brusselator	253
5.6 Aircraft at high angles of attack	257
5.7 Urban systems	259

6 CONCLUDING REMARKS	262
