Preface to the English Edition v

Foreword ix

Introduction xi

1. Formulation of Problems and Research Techniques in Structural Optimization 1

1.1. Formulation of Some Optimal Design Problems 1
1.2. Basic Functionals 5
1.3. Principal and Auxiliary Control Functions 12
1.4. Application of Variational Principles of the Theory of Elasticity to Eliminating Differential Relations 17
1.5. Reduction to Problems with Integral Functions 22
1.6. Necessary Conditions for Optimality 29
1.7. Extremal Conditions for Problems with Nonadditive Functionals 36
1.8. Problems with Unknown Boundaries 41
1.9. Dual Problems 47
1.10. Application of Numerical Techniques in Solving Problems of Optimal Design 52

2. One-Dimensional Optimization Problems 63

2.1. Optimization Problems for Beams Subjected to Bending 63
2.2. Optimization of Stability for Elastic Beams 78
2.3. Optimal Configuration of Branched Beams 83
2.4. Design of Optimum Curved Beams 89
2.5. Optimization of Nonuniformly Heated and Prestressed Beams 100

3. Optimal Design of Elastic Plates: Control by Varying Coefficients of the Equations **109**

3.1. Plates Having the Greatest Rigidity 109
3.2. Numerical Search for Optimal Thickness Distribution of Homogeneous Plates 115
3.3. Optimal Rigidity of Trilayer Plates 121
3.4. Strongest Plates 127
3.5. Optimum Support Conditions for Thin Plates 131

4. Optimization Problems with Unknown Boundaries in the Theory of Elasticity: Control by Varying the Boundary of the Domain **135**

4.1. Maximizing the Torsional Rigidity of a Bar 136
4.2. Finding Optimum Shapes of Cross-Sectional Areas for Bars in Torsion 140
4.3. Torsion of Piecewise Homogeneous Bars and Problems of Optimal Reinforcement 148
4.4. Optimization of Stress Concentration for Elastic Plates with Holes 157
4.5. Determining the Shape of Uniformly Stressed Holes 164
4.6. Optimization of the Shapes of Holes in Plates Subjected to Bending 172

5. Optimization of Anisotropic Properties of Elastic Bodies **181**

5.1. Optimization Problems for Anisotropic Bodies 181
5.2. An Extremal Problem for Rotation of a Matrix 185
5.3. Optimal Anisotropy for Bars in Torsion 189
5.4. Optimization of Anisotropic Properties of an Elastic Medium in Two-Dimensional Problems of the Theory of Elasticity . . . 193
5.5. Computation of Optimum Anisotropic Properties for Elastic Bodies 200
5.6. Some Comments Concerning the Shapes of Anisotropic Bodies and Problems of Simultaneous Optimization of the Shape and of the Orientation of Axes of Anisotropy 204

6. Optimal Design in Problems of Hydroelasticity **209**

6.1. State Equations for Plates That Vibrate in an Ideal Fluid 209
6.2. Optimizing the Frequency of Vibrations 215
6.3. Determining the Reaction of a Fluid When the Flow Field and the Motion of the Plate are Two-Dimensional and the Flow is Solenoidal 220
6.4. Finding the Optimum Shape of a Vibrating Plate 223
6.5. Maximizing the Divergence Velocity of a Plate Subjected to the Flow of an Ideal Fluid 228
6.6. A Scheme in Solenoidal Flow for Investigating Equilibrium Shapes of Elastic Plates and a Problem of Optimization 232

7. Optimal Design under Conditions of Incomplete Information Concerning External Actions and Problems of Multipurpose Optimization 243

7.1. Formulation of Optimization Problems under Conditions of Incomplete Information 243
7.2. Design of Beams Having the Smallest Weight for Certain Classes of Loads and with Constraints of Strength 246
7.3. Optimization of Rigidity for Beams 254
7.4. Design of Plates for Certain Classes of Loads 259
7.5. Optimization of Beams Subjected to Bending and Torsion. Multiple Criteria Optimization Problems 265
7.6. Design of a Circular Plate Having Minimum Weight with Constraints on Rigidity and Natural Frequencies of Vibrations 272
7.7. Construction of Quasi-Optimal Solutions to the Multipurpose Design Problems 277

Bibliography **287**

Index **311**
