PART I THEORY

Chapter 1 HYBRID SIMULATION OF DISTRIBUTED PARAMETER SYSTEMS S. G. Tzafestas

Introduction	1
Distributed-Parameter Models	2
- Parabolic models	2
- Hyperbolic models	3
- Elliptic models	3
- A general scalar model	4
Hybrid Distributed-Parameter Simulation Methods	4
- Discrete-time continuous-space methods	5
Decomposition method	6
Green function method	8
Integral equation method	10
Optimal control method	11
Invariant imbedding method	12
- Continuous-time discrete-space methods	13
Cell multiplexing method	13
Regional multiplexing method	14
Differential-difference method	16
Block time-sharing method	16
Partial multiplexing method	18
Other multiplexing methods	20
- Modal expansion methods	21
Ritz-Galerkin method	21
Extended space technique	24
- Further hybrid methods	25
Method of Characteristics	25
Implicit simulation method	27
Power series expansion method	28
Monte Carlo method	30
General Implementation Aspects	33

Stability Analysis of Hybrid Simulation Methods	36
Experimental Results	39
- Application of DTCS methods (Examples 1-3)	39
- Application of CTDS methods (Examples 4-7)	41
- Application of modal and other hybrid methods (Examples 8-12)	44
Conclusions	51
References	52

Chapter 2

IDENTIFICATION OF DISTRIBUTED-PARAMETER SYSTEMS

Y. Sunahara

Introduction	57
- Retrospective review	57
- Scope of the chapter	58
Exhibition of Mathematical Models	58
- DPS subject to additive noise	59
- DPS with stochastic coefficients	59
- DPS with free boundary	60
- DPS with inequality boundary conditions	61
Specific Results for Identification in Stochastic Distributed-Parameter Systems	63
- Example 1: Parameter identification involved in the spatially distributed input	63
- Example 2: Parameter identification involved in the system dynamics of parabolic type-stochastic inverse problem	74
Conclusions	85
Acknowledgements	85
References	85

Chapter 3

FILTERING, SMOOTHING, AND PREDICTION OF DISTRIBUTED PARAMETER SYSTEMS: SURVEY OF RIGOROUS APPROACH

S. Omatu

Introduction	87
Formal Approach Based on the Wiener-Hopf Theory	87
- Description of the dynamical systems	88
- Estimation problems and Wiener-Hopf theory	89
- Derivation of the optimal prediction estimator	91
- Derivation of the optimal filter	92
- Derivation of the optimal smoothing estimator	95
- Historical notes and related works	98
Rigorous Approaches to Optimal Estimation Problems	99
- Description of the dynamical systems	99
- Preliminary results	100
- Problem formulation	103
- Wiener-Hopf theory	103
- Derivation of the optimal prediction estimator	106
- Derivation of the optimal filtering estimator	107
- Derivation of the optimal smoothing estimator	110
- Related works	114

Chapter 4
 SOME METHODS FOR ANALYSING THE STABILITY AND
 THE HYPERSTABILITY OF DISTRIBUTED PARAMETER
 SYSTEMS
 G. Jumarie

Foreword	119
Introduction	120
Stability and Hyperstability	120
- Autonomous systems	121
- Non autonomous systems	121
Definition of Distributed Parameter Systems	122
- A few notations	122
- Differential equations	123
- Integral equation	124
- Laplace-Green function	124
- Transfer function in space and time	125
- State vector	125
A General Result on the Stability of DPS	126
- Systems without boundary feedback	126
- Systems with boundary control	127
- Systems with distributed control and boundary control	127
Space Mean Square Stability Criteria for a Class of Distributed Systems with Constant Coefficients	127
- Definitions and notations	127
- A few comments	128
Stability of Distributed Systems with Variable Coefficients by Reducing to Distributed Systems with Constant Coefficients	129
- Derivation of an associated system	129
- Successive integrations	129
Stability Criteria for Nonlinear Distributed Systems Defined by Laplace-Green Functions	130
- The model	130
- Main result	131
- A few Corollaries	131
- Extensions	132
Hyperstability of Nonlinear Distributed Systems	134
- Definition of the system	134
- Polarized system	134
- Characteristic function	135
- Main result	135
- Extensions	135
Space Sampling Effect	138
- Transfer function in space and time	138
- Systems defined by Laplace-Green functions	138
- Systems defined by state-vector	139
- A few remarks	139
Stability of DPS in the Presence of Random Disturbances	140
- Mathematics or Physics?	140
- A model for distributed white noises	141
- Stochastic distributed systems	142
- Application to the stability of stochastic distributed systems	143

Conclusions	143
References	144

Chapter 5
 STABILITY AND OPTIMAL CONTROL OF STOCHASTIC
 EVOLUTION EQUATIONS
 A. Ichikawa

Introduction	147
Semigroup Theory	148
- Strongly continuous semigroups	148
- Inhomogeneous equations	150
- Examples	151
- Comments	153
Quadratic Cost Control Problem	153
- Quadratic control on a finite interval	153
- Quadratic control on an infinite interval	156
- Stability of semilinear evolution equations	159
- Examples	159
- Comments	160
Stochastic Evolution Equations	161
- Stochastic integrals in Hilbert space	161
- Stochastic evolution equations	163
- Ito's formula	164
- Comments	165
Stochastic Stability	166
- Ito's formula and mild solutions	166
- Stability of linear equations	167
- Stability of semilinear equations	168
- Examples	169
- Comments	169
Stochastic Quadratic Control	170
- Optimal control on a finite interval	170
- Optimal control on an infinite interval	171
- Examples	173
- Comments	174
References	174

Chapter 6
 ADAPTIVE AND ROBUSTNESS PROPERTIES OF CERTAIN
 BILINEAR DISTRIBUTED PARAMETER CONTROL SYSTEMS
 D. Franke

Introduction	179
State Equations of a Class of Bilinear Distributed Parameter Systems	180
- Systems with inherent parametric control	180
- Variable structure feedback control of linear distributed-parameter systems	183
A Summary of Available Results in the Control of Bilinear Distributed Parameter Systems	184
Bilinear Control: A Tool for the Design of Adaptive and Robust Distributed Parameter Systems	189

- Motivation for adaptive bilinear control	189
- Lyapunov design of multiplicative feedback control with adaptive and robustness properties	190
Problem formulation	190
Process coinciding with the model	192
Example	193
Disturbance which allows steady state coincidence with the model	195
Example	199
A modification which avoids construction of a Lyapunov functional	206
- Feedback control with independent additive and multiplicative control variables	208
Statement of control problem	208
Outline of design procedure	209
- A solution to the model following problem	209
Concluding Comments	210
References	211

Chapter 7
 COORDINATED CONTROL OF DISTRIBUTED PARAMETER SYSTEMS
 K. Y. Lee

Introduction	213
Decomposition	214
- Basic problem formulation	214
- Decomposition by finite difference scheme	215
Discrete approximation by finite difference	216
Decomposition into subsystems	218
- Decomposition by finite element scheme	219
Discrete approximation by finite element	219
Decomposition into subsystems	223
- Decomposition by integration scheme	223
Partitioning into subsystems	224
Integration method	225
Coordinated Control	227
- Formulation of coordinated control problem	227
- Computational considerations	229
Gauss-Seidel iterative scheme	229
Gradient and conjugate gradient schemes	230
- Linear quadratic problems	231
- Systems decomposed by integration scheme	233
Conclusion	235
References	236

Chapter 8
 THE FINITE ELEMENT METHOD IN DISTRIBUTED PARAMETER CONTROL SYSTEMS
 L. Carotenuto and G. Raiconi

Introduction	239
Construction of Finite Element(f.e.) Spaces	240

- Approximation properties of f.e. spaces	245
The Finite Element Method for Elliptic	
Boundary Value Problems	246
- Variational equations	246
- The Ritz-Galerkin method	248
- Finite element solution of elliptic equations	249
Finite Element Approximation for Initial Value Problems	254
- The semi-discrete Galerkin approximation	254
- The approximation of eigenfunction expansion	257
Finite Element Applications to Control Systems	259
- Example 1: A parametric identification problem	260
- Example 2: A state estimation problem	262
- Example 3: A linear quadratic open-loop control problem	264
Acknowledgments	268
Notations for the Function Spaces Used	268
References	269

Chapter 9

APPROXIMATION METHODS FOR DISTRIBUTED PARAMETER SYSTEMS

T. I. Seidman

Introduction	273
General Remarks	274
Some Examples	275
- Example 1: Control of heat equation	276
- Example 2: System identification	278
- Example 3: Signal recovering from diffused observation	280
- Example 4: Nonlinear variant of example 3	285
Further Examples	286
- Example 5: Dirichlet nullcontrol for an inhomogeneous body	287
- Example 6: Application of Faedo-Galerkin semi-discretisation	289
- Example 7: Optimal approximate Neumann control problem	290
Concluding Remarks	292

Chapter 10

SELECTION OF MEASUREMENT AND CONTROL LOCATIONS IN DISTRIBUTED PARAMETER SYSTEMS

M. Amouroux and J.P. Babary

Introduction	295
Control Location Problem	296
- Problem formulation	297
- Optimality criterion	297
- Solution method	298
- Suboptimal control and optimisation of actuators	299
- Criterion independent of the initial and final states	302
- Example 1: Pointwise control	302
- Example 2: Zone of action	305
Sensor Location Problem	307
- Problem formulation	307

- Optimal estimation	308
- Solution of the filter equations	309
- Suboptimal solution and the optimal sensor locations algorithm	310
- Example	311
Sensor and Control Location Problem	313
- Minimum energy problem with unknown initial state	313
- Example	319
- Stochastic regulator problem	322
- Example	324
Conclusion	324
References	325

PART II APPLICATIONS

Chapter 11
 EXPERIMENTAL APPLICATION OF DISTRIBUTED
 PARAMETER CONTROL THEORY
 G. K. Lausterer and Ed. Eitelberg

Introduction	329
A One-Dimensional Linear Example	330
- Description of the process	330
- Modal control	332
Algorithm	332
Experimental results	333
- Control with filter	333
Filter algorithm	333
Experimental results	335
- Control with observer	337
Observer algorithm	337
Open and closed-loop performance	337
- Conclusions	339
A Two Dimensional Linear Example	339
- Description of the process	339
- Optimal state estimation	344
- Optimal feedback control	345
- Modal decomposition	346
- Suboptimal Riccati equations	348
- Choice of the weighting functions	349
- Experimental results	351
Accuracy of the modal approximation	352
Comparison of filter performance	354
Influence of number and location of sensors	356
Analysis of combined and controller performance	357
Real-time and memory requirements	358
- Conclusions	358
A Moving Boundary Problem	360
- Description of the process	360
- State estimation	361
- Conclusions	362

Discussion of Practical Problems	363
- Physical investigations	363
- Design considerations	363
- Practical implementation	364
Summary and Outlook	365
References	365

Chapter 12
 DISTRIBUTED PARAMETER IDENTIFICATION IN
 GEOPHYSICS-PETROLEUM RESERVOIRS AND AQUIFERS
 J. H. Seinfeld and C. Kravaris

Introduction	367
Survey of Literature in Reservoir and Aquifer Identification	369
Methods for Solution of the Identification Problem	371
- Zonation	371
- Statistical aspects of the identification process	372
Regularisation Methods for the Solution of Ill-Posed Problems	374
- Introduction	374
- The concepts of well-posed and ill-posed problems	375
- The regularisation method	375
- The approach of Miller	379
- Wahba's version of the regularisation method-Weighted Cross Validation	382
Regularisation Approach to the Identification Problem	385
References	388

Chapter 13
 IDENTIFICATION FOR DISTRIBUTED PARAMETER CHEMICAL
 ENGINEERING SYSTEMS-FIXED-BED TUBULAR REACTORS
 W. Fred Ramirez

Introduction	391
Scope of Chemical Engineering Applications	391
Fixed-Bed Catalytic Reactors	392
Steady-State Sequential Distributed Filtering	396
References	415

Chapter 14
 DISTRIBUTED PARAMETER HEAT EXCHANGERS-
 MODELING, DYNAMICS AND CONTROL
 H. Kanoh

Introduction	417
History of Research on Modeling and Dynamics of Heat Exchangers	417
- Dynamics of one-dimensional-flow heat exchangers	417
- Flow forced dynamics	418
- Cross-flow heat exchangers	419
- Simulation of heat exchangers	419

Modeling of Heat Exchangers	421
- Derivation of basic equation	421
- One dimensional flow heat exchangers	423
- Flow forced heat exchangers	423
- Rotary regenerative heat exchanger	427
Analysis of Dynamic Behaviour of Heat Exchangers	428
- General method to calculate response	428
- A special case: Matrix A does not depend on x	429
- Transfer function of typical heat exchangers	431
Properties of Dynamics of Heat Exchangers	434
- Resonance phenomena of frequency response of heat exchangers	434
- Resonance and controllability	435
- Types of heat exchanger dynamics	436
- Stability limit and types of dynamics	437
- Effect of wall heat capacity	438
Lumped Parameter Simulation of Heat Exchangers by Method of Weighted Residuals	439
- Outline of the method	439
- One-shell multi-pass heat exchangers	440
- Cross-flow heat exchanger	442
A Survey of Research in Control Problems of Heat Exchangers	442
References	444
Bibliography of Dynamics and Control of Heat Exchangers	444

Chapter 15
 MODELING AND CONTROL OF DISTRIBUTED PARAMETER
 NUCLEAR REACTORS
 D. M. Wiberg

Introduction	451
Nuclear Reactor Distributed State Equations	452
The Linear Stochastic Model with Control	456
Examples I-IV	462
Non-Interacting Modal Expansions	465
The Modal Approach to Filtering and Control	468
Filtering of a Liquid Metal Fast Breeder Reactor	482
- Premature discretisation of the delay equation	490
References	492
