

# Contents

1. Continuity	1
1. Strong and weak continuity in Banach spaces	1
2. Strong and weak continuity in Hilbert spaces	5
2. Differentiability	9
1. Weak and strong differentiability	9
2. The Gateaux differential	11
3. Continuity, differentiability and integration in locally convex spaces	13
1. Continuity	13
2. Differentiability	15
3. Integration	16
4. Almost-periodic functions from the real line into a Banach space	19
1. Definitions and elementary properties	19
2. Normal functions	25
5. Asymptotically almost-periodic functions	35
1. Definitions and elementary properties	35
2. The class $F(\mathbb{R}^+; X)$	40
3. The class $\mathcal{B}(\mathbb{R}^+; X)$	44
6. Precompact families of vector-valued functions	48
1. Arzela-Ascoli's theorem	48
2. Families of almost-periodic functions	50
3. Families of normal functions	55
7. Integration of almost-periodic functions	58
1. Theorem of Bochner in general Banach spaces	58
2. Theorem of Amerio in Hilbert spaces	61
8. Almost-automorphic functions	66
1. Elementary definitions and properties	66

2. Weak almost-automorphy	68
3. Integration theory	69
9. Almost-periodic functions from $\mathbb{R}^n$ into a Banach space	72
1. Elementary properties	72
2. Normal functions	77
3. Families of almost-periodic functions	79
4. Further remarks : the Bochner transform	81
10. Mean-value and Fourier series of a.p. functions (I)	85
1. The mean-value theorem	85
2. Fourier series	91
11. Weakly almost-periodic functions	96
1. Elementary properties	96
2. Mean value and Fourier series	100
3. Weak and strong almost-periodicity	102
12. Mean value and Fourier series of a.p. functions (II)	106
1. First properties	106
2. Equality of Parseval and the uniqueness theorem	109
13. Almost-periodic functions on abstract groups	114
1. A criterion of total-boundedness for families of functions	114
2. Almost-periodic functions from a group into a Banach space	117
