

CONTENTS

Preface	v
List of symbols	x
Introduction	1
Chapter I. Diophantine approximations to real numbers	4
1. Some classical results in Diophantine approximations	4
2. Measure-theoretical methods in Diophantine approximations	7
3. Badly approximable real numbers	10
4. Diophantine approximations and prediction of the size of trigonometric sums	17
5. Kronecker's theorem and problems with a large number of equations	21
6. Pisot and Salem numbers	25
7. Pisot numbers, Salem numbers and harmonious sets of real numbers	35
8. Notes	39
Chapter II. Diophantine approximations and additive problems in locally compact abelian groups	40
1. Preliminaries on l.c.a. groups	40
2. Harmonious sets	42
3. Basic properties of harmonious sets	43
4. Construction of harmonious sets in l.c.a. groups (the lacunary case)	46
5. Construction of relatively dense harmonious sets	48
6. Relatively dense harmonious sets of real numbers	54
7. Quantitative problems	55
8. Harmonious sets of real numbers closed under multiplication	57
9. Another definition of models of real numbers	59
10. Harmonious sets in p -adic fields	60
11. Counter-examples	64
12. Pisot-Salem-Chabauty numbers in \mathbf{Q}_p	64
13. Adeles and harmonious sets closed under multiplication	68
14. Characterization of harmonious sets by additive properties	71
15. Notes	80
Chapter III. Uniqueness of representation by trigonometric series	81
1. Riemann's theory	81
2. Symmetric sets	87
3. Pisot numbers and uniqueness	89
4. Results for symmetric sets	93

5. Other results for symmetric sets	96
6. Sets of uniqueness in general l.c.a. groups	97
7. The p -adic case	100
8. Generalizations	102
9. Other results on the problem of uniqueness	103
10. Notes	103
 Chapter IV. Problems on a-periodic trigonometric sums	 104
1. Elementary properties of almost-periodic functions	105
2. Classes of almost-periodic functions	106
3. Dilations and classes of almost-periodic functions on the line	109
4. Classes of almost-periodic functions and a priori estimates on the size	110
5. Pisot numbers and coherent sets of frequencies: the real case	110
6. A set of powers	112
7. Pisot numbers and coherent sets of frequencies: the p -adic case	112
8. The groups \mathbf{C} and \mathbf{R}^2	113
9. Coherent sets of frequencies in l.c.a. groups	114
10. Coherent sets of frequencies and restriction algebras	115
11. Other definitions of coherent sets of frequencies	119
12. Other relations between $A(E)$, $B(E)$ and L_E^∞	120
13. Slowly-perturbed trigonometric sums	121
14. Coherent sets of frequencies and isomorphisms	126
15. Improvement on the preceding results when \mathcal{A} is harmonious	128
16. A new characterization of Pisot numbers	136
17. Slowly-perturbed trigonometric sums in the real case	138
18. Notes	139
 Interlude	 140
 Chapter V. Special trigonometric series (complex methods)	 142
1. The Laplace transform	142
2. The Paley-Wiener theorem	146
3. Repartition of roots of entire function of exponential type	148
4. Bernstein's inequality	149
5. Other inequalities of Bernstein type	150
6. Irrational numbers and special trigonometric series	152
7. Special trigonometric series: the a-periodic case	157
8. Special trigonometric series on p -adic fields	162
9. Mean periodic functions	169
10. Notes	181
 Chapter VI. Special trigonometric series (group-theoretic methods)	 183
<i>A. Topological Sidon sets of real numbers</i>	183
1. Definition and basic properties of topological Sidon sets	183
2. Examples of topological Sidon sets	185
3. Construction of remarkable measures associated with topological Sidon sets	185
4. The union of two topological Sidon sets	189
5. Topological Sidon sets and stability of coherent sets of frequencies	190
6. Interpolation of bounded functions defined on a topological Sidon set by the Fourier-transforms of complex bounded Radon measures on \mathbf{R}	193

7. Estimates for trigonometric sums whose frequencies belong to a topological Sidon set	194
<i>B. Idempotent and semi-idempotent measures</i>	199
8. Idempotent measures on l.c.a. groups	199
9. Semi-idempotent measures	206
10. Behaviour at infinity of special a -periodic trigonometric series	211
11. Notes	212
Chapter VII. Pisot numbers and spectral synthesis	213
1. Spectral synthesis and structure of closed ideals of a group algebra	213
2. Spectral synthesis and atomization of distributions	217
3. A strong form of spectral synthesis	218
4. Spectral synthesis and weighted approximation	221
5. Pisot numbers and spectral synthesis	222
6. Bochner's property for a Banach algebra	226
7. Bochner's property and harmonic analysis	228
8. The p -adic case	233
9. Notes	237
Chapter VIII. Ultra-thin symmetric sets	238
1. Properties of ultra-thin symmetric sets	238
2. Functions whose spectra lie in ultra-thin symmetric sets	239
3. Theorem I as a corollary of Theorem II	242
4. Proof of Theorem II: reduction to a problem on intervals	244
5. Symmetric coherent sets of frequencies	247
6. High frequencies and independence; complements	249
7. From the group \mathbf{R} to the group D^∞	251
8. Spectral synthesis fails in $A(D^\infty)$	253
9. Spectral synthesis fails in $A(E)$ and $A(\mathbf{R})$	255
10. Counter-examples. A random set due to Salem	256
11. Other random sets	260
12. Notes	262
Conclusion	263
Some open problems about symmetric sets	264
Open problems. Special trigonometric series on local fields	265
Appendix	266
Bibliography	270
Index	274
