

Table of Contents

Chapter 0. Introduction	1
Chapter I. Circle Diffeomorphisms	14
1. The Combinatorial Theory of Poincaré	16
2. The Topological Theory of Denjoy	36
2.a The Denjoy Inequality	47
2.b Ergodicity	48
3. Smooth Conjugacy Results	50
4. Families of Circle Diffeomorphisms; Arnol'd tongues	68
5. Counter-Examples to Smooth Linearizability	73
6. Frequency of Smooth Linearizability in Families	76
7. Some Historical Comments and Further Remarks	78
Chapter II. The Combinatorics of One-Dimensional Endomorphisms	81
1. The Theorem of Sarkovskii	82
2. Covering Maps of the Circle as Dynamical Systems	88
3. The Kneading Theory and Combinatorial Equivalence	92
3.a Examples	107
3.b Hofbauer's Tower Construction	108
4. Full Families and Realization of Maps	115
5. Families of Maps and Renormalization	138
6. Piecewise Monotone Maps can be Modelled by Polynomial Maps	153
7. The Topological Entropy	163
8. The Piecewise Linear Model	171
9. Continuity of the Topological Entropy	186
10. Monotonicity of the Kneading Invariant for the Quadratic Family	194
11. Some Historical Comments and Further Remarks	198
Chapter III. Structural Stability and Hyperbolicity	201
1. The Dynamics of Rational Mappings	202
2. Structural Stability and Hyperbolicity	216
3. Hyperbolicity in Maps with Negative Schwarzian Derivative	230
4. The Structure of the Non-Wandering Set	235

5. Hyperbolicity in Smooth Maps	247
6. Misiurewicz Maps are Almost Hyperbolic	257
7. Some Further Remarks and Open Questions	264
Chapter IV. The Structure of Smooth Maps	267
1. The Cross-Ratio: the Minimum and Koebe Principle	271
1.a Some Facts about the Schwarzian Derivative	282
2. Distortion of Cross-Ratios	285
2.a The Zygmund Conditions	291
3. Koebe Principles on Iterates	295
4. Some Simplifications and the Induction Assumption	302
5. The Pullback of Space: the Koebe/Contraction Principle	305
6. Disjointness of Orbits of Intervals	308
7. Wandering Intervals Accumulate on Turning Points	312
8. Topological Properties of a Unimodal Pullback	315
9. The Non-Existence of Wandering Intervals	319
10. Finiteness of Attractors	321
11. Some Further Remarks and Open Questions	325
Chapter V. Ergodic Properties and Invariant Measures	327
1. Ergodicity, Attractors and Bowen-Ruelle-Sinai Measures	329
2. Invariant Measures for Markov Maps	351
3. Constructing Invariant Measures by Inducing	362
4. Constructing Invariant Measures by Pulling Back	375
5. Transitive Maps Without Finite Continuous Measures	393
6. Frequency of Maps with Positive Liapounov Exponents in Families and Jakobson's Theorem	401
7. Some Further Remarks and Open Questions	433
Chapter VI. Renormalization	437
1. The Renormalization Operator	438
2. The Real Bounds	453
3. Bounded Geometry	461
4. The PullBack Argument	465
5. The Complex Bounds	483
6. Riemann Surface Laminations	499
7. The Almost Geodesic Principle	524
8. Renormalization is Contracting	533
9. Universality of the Attracting Cantor Set	546
10. Some Further Remarks and Open Questions	553

Chapter VII. Appendix	555
1. Some Terminology in Dynamical Systems	555
2. Some Background in Topology	556
3. Some Results from Analysis and Measure Theory	558
4. Some Results from Ergodic Theory	560
5. Some Background in Complex Analysis	561
6. Some Results from Functional Analysis	581
Bibliography	582
Subject Index	600
