Contents

CHAPTER ONE

Difference Equations 1

1.1.	Introduction	1
1.2.	Difference operators. Newton's formula	7
1.3.	Formulation of difference equations	10
1.4.	Summation and differencing	13
1.5.	Special finite sums	18
1.6.	Linear difference equations of first order	24
1.7.	Homogeneous linear difference equations with constant coefficients	26
1.8.	Particular solutions of nonhomogeneous linear equations	31
1.9.	The loaded string	35
1.10.	Characteristic-value problems	41
1.11.	Matrix notation	44
1.12.	Symmetry and periodicity conditions	46
1.13.	Discrete Fourier representations	49
1.14.	The vibrating loaded string	54
1.15.	Infinite ranges. The Fourier transform	55
1.16.	Special devices	59
1.17.	Factorial series solutions	60
1.18.	Generating functions	63
1.19.	Applications of generating functions	69
1.20.	Simultaneous difference equations. Matrix methods	73
	References	78
	Problems	79

CHAPTER TWO

Numerical Solution of Ordinary Differential Equations 122

2.1.	Introduction	122
2.2.	Difference approximations to derivatives	122
2.3.	Numerical integration formulas	126
2.4.	Use of Taylor series	128
2.5.	First-order equations. Euler's method	130
2.6.	First-order equations. Derivative-approximation methods	132
2.7.	First-order equations. Integral-approximation methods	136
2.8.	Consistency conditions, strong instability, and convergence	140
2.9.	First-order equations. Methods of Runge-Kutta type	145
2.10.	Higher-order equations. Sets of equations	146
2.11.	Boundary-value problems	151
2.12.	Linear characteristic-value problems	156
2.13.	Simulation of boundary conditions involving a derivative	158
2.14.	Propagation of truncation errors	159
2.15.	Error bounds for Euler's method	161
2.16.	Error estimates for Euler's method	165
2.17.	Propagation of round-off errors	166
2.18.	The process of h-extrapolation	167
2.19.	A simple numerical example	169
	References	172
	Problems	172

CHAPTER THREE

Numerical Solution of Partial Differential Equations 185

3.1.	Introduction. Classification of partial differential equations	185
3.2.	The heat-flow equation (infinite interval). Formulation and simulation	194
3.3.	Error propagation	199
3.4.	Stepwise and pointwise instability	202
3.5.	Pointwise convergence. Error bounds	205
3.6.	Implicit formulations	209
3.7.	Stability of implicit formulations. Computation	212
3.8.	The heat-flow equation (finite interval)	216
3.9.	Simulation of end conditions	220
3.10.	Other linear parabolic equations. Sufficient conditions for stepwise stability	226

3.11. Nonlinear parabolic equations. Local stability 231
3.12. The wave equation 234
3.13. Stepwise overstability 240
3.14. Other hyperbolic equations. The method of characteristics 242
3.15. The method of characteristics for simultaneous equations 247
3.16. Simulation of Laplace's equation 249
3.17. Simultaneous relaxation 253
3.18. Methods of successive relaxation 256
3.19. Error bounds for the simulated Dirichlet problem 260
3.20. Simulation of boundary conditions 266
3.21. Other elliptic equations. Relaxation convergence 272
3.22. Characteristic-value problems 278
3.23. The vibrating rectangular membrane 281
3.24. The two-dimensional heat-flow equation 285
References 290
Problems 291
