Preface	v
List of symbols	vii
1 Initial orientation	1
1.1 Origins of nonlinearity	1
1.2 Definition of nonlinearity	1
1.3 Types of behaviour found in nonlinear systems	2
1.4 Failure of linear techniques	3
1.5 Approaches to nonlinear system analysis	4
2 Dynamic Systems — definitions and notation	5
2.0 Introduction	5
2.1 Dynamic system axioms	5
2.2 Trajectories and critical points	6
2.3 Definitions of stability	6
2.4 Representation of a system by differential equations	7
2.5 First order scalar differential equations	7
2.5.1 Theorem 2.1	8
2.5.2 Definition	8
2.5.3 Theorem 2.2	8
2.6 Systems of first order equations	8
2.7 Vector field aspects	9
2.8 Limit cycles	9
3 The describing function method	10
3.0 Introduction	10
3.1 Outline of the method	10
3.2 Justification for the describing function method	12
3.3 Stability of self-excited oscillations	12
3.4 Derivation of the Fourier series for $f(a \sin \omega t)$	12
3.5 Determination of Fourier coefficients without integration	13
3.5.1 Simple example	14
3.6 Examples	15
3.6.1 Ideal relay	15
3.6.2 Relay with dead zone	16
3.6.3 Cubic non-linearity	17

3.6.4	Example 4	19
3.6.5	Linear element with hysteresis	21
3.7	Concluding remarks	22
4	The phase plane portrait	23
4.0	Introduction	23
4.1	Definition	23
4.2	Simple examples illustrating behaviour in the phase plane	23
4.2.1	A second-order linear process without damping	23
4.2.2	A second-order linear process with damping	24
4.3	The direction of rotation of oscillatory trajectories in the phase plane	25
4.3.1	Example	26
4.4	Switching lines in the phase plane	26
4.5	Discussion	28
5	Linearisation	29
5.0	Introduction	29
5.1	The principle of linearisation	29
5.1.1	Nonlinear second-order systems with one input and two outputs	30
5.2	Linearisation about an analytically specified trajectory	31
5.3	Other approaches to linearisation	32
6	Determination of the qualitative behaviour of a nonlinear second-order system by linearisation (Lyapunov's first method)	33
6.0	Introduction	33
6.1	Critical points of a system	33
6.2	Critical point analysis of a linear second-order system	34
6.3	Critical points of nonlinear systems	38
6.4	Critical point analysis of a second-order nonlinear system	39
6.5	System behaviour near to a critical point	39
6.6	Special cases not covered in the table of Section 6.2	41
6.6.1	Repeated eigenvalues	41
6.6.2	Repeated eigenvalues — special case	42
6.6.3	One eigenvalue is zero	42
6.7	Examples	42
6.7.1	Example 1	42
6.7.2	Example 2	46
6.8	Time-varying problems	46
6.8.1	Theorem 6.1	47
6.9	Obtaining information on global stability properties from the linear approximation	48
6.9.1	Theorem 6.2	48
7	Lyapunov's second or direct method	49
7.0	Introduction	49
7.1	Preliminary definitions	50
7.2	Lyapunov's second (or direct) stability theorem	50
7.3	Cetaev instability theorem	50
7.4	Geometric interpretation	51
7.5	Determination of the extent of a region of asymptotic stability around the origin	52

7.6	The search for a Lyapunov function	52
7.7	Examples	52
7.7.1	Example 1	52
7.7.2	Example 2	53
7.7.3	Example 3	54
7.7.4	Example 4	56
7.7.5	Example 5	56
7.8	Lyapunov's direct method for time-varying problems	58
7.8.1	Stability theorem	58
7.9	Use of the Lyapunov direct method as a design tool	58
7.10	Concluding remarks	59
8	Envelope methods — the Popov and circle criteria for graphical analysis of a single feedback loop containing a nonlinear element	60
8.0	Introduction	60
8.1	The Aizerman and Kalman conjectures	60
8.1.1	Aizerman's conjecture	60
8.1.2	Kalman's conjecture	61
8.2	The Popov stability criterion	61
8.3	The circle method	62
9	Limit cycles and relaxation oscillations	66
9.0	Introduction	66
9.1	Limit cycle — definition	66
9.2	Asymptotic stability	68
9.2.1	Theorem 9.1	68
9.3	The Poincaré index and its implications in the phase plane	68
9.3.1	Bendixson's first theorem	69
9.3.2	Implications	69
9.3.3	Bendixson's second theorem	69
9.3.4	Theorem 9.2	70
9.4	Relaxation oscillations	70
9.4.1	Example	70
10	Liénard's equation	72
10.0	Introduction	72
10.1	Liénard's equation — definition	72
10.1.1	Restrictions on the functions f and g	72
10.2	Analysis of Liénard's equation by Lyapunov's direct method	73
10.3	Examples	73
10.3.1	Example 1	73
10.3.2	Example 2. Van der Pol's equation	73
10.4	Existence of a limit cycle for Liénard's equation	74
10.5	A particular example of Liénard's equation that has a stable limit cycle	75
11	Gradient systems and system decomposition	77
11.0	Introduction	77
11.1	Gradient systems	77
11.2	Example of a gradient system	78
11.3	Decomposition of a second-order system — introduction	79
11.4	The decomposition method for second-order nonlinear systems	80
11.4.1	Theorem 11.1	80
11.4.2	Theorem 11.2	81

11.5	Examples	81
11.5.1	Example 1— Linear system with a stable node	81
11.5.2	Example 2	81
12	References	84
13	Bibliography	86
13.1	Further historical and supporting literature	86
13.2	Theoretical foundations	86
13.3	Multivariable and discrete time systems	87
13.4	Other control theory	88
13.5	Selected application papers	88
