Contents

PREFACE v

Part I. Mathematical Foundations

Chapter 1. FOURIER SERIES 1
1.1 Introduction 1
1.2 Basic formulae for Fourier series expansion 2
1.3 Useful information relating to the basic equations 3
1.4 Table of Fourier series for a few illustrative functions 6

Chapter 2. FOURIER TRANSFORMS 8
2.1 Introduction 8
2.2 The basic formulae for Fourier transforms 8
2.3 Useful information relating to Fourier integrals 10
2.4 Relations between Fourier pairs 15
2.5 Table of Fourier transforms 20

Chapter 3. FOURIER INTEGRALS IN SEVERAL DIMENSIONS .. 40
3.1 The basic result in n dimensions 40
3.2 Use of vectors 41
3.3 Simple operational results 42
3.4 Delta functions in three dimensions 42
3.5 Delta functions in two dimensions 44
3.6 Relations between Fourier pairs in several dimensions 44
3.7 Table of two-dimensional transforms 47
3.8 Table of three-dimensional transforms 51

Chapter 4. ENERGY SPECTRA AND POWER SPECTRA 56
4.1 Introduction 56
4.2 Energy spectrum 58
4.3 Power spectrum 59
4.4 Physical quantities as the real parts of complex quantities 61
4.5 Spectra in several dimensions 63
4.6 Relations between functions and their spectra 64

Chapter 5. CONVOLUTION AND CORRELATION 66
5.1 Convolution (faltung or folding). Definition and meaning .. 66
5.2 Cross-correlation function. Definition and meaning 68
5.3 Autocorrelation function. Definition and meaning 71
5.4 The convolution and Wiener–Khintchine theorems 73
5.5 Summary of relationships 74

Chapter 6. RANDOM FUNCTIONS 77
6.1 Introduction 77
6.2 Stationary random functions 78
6.3 Signals with non-zero mean 81
6.4 Sum of signals 81
6.5 Shot noise 82
6.6 Random amplitude modulation of a carrier wave 83
6.7 Random phase modulation 85
6.8 Random telegraph signal – first type 87
6.9 Random telegraph signal – second type 88

Part II. Applications

Chapter 7. LINEAR SYSTEMS 91
7.1 Introduction 91
7.2 Impulse response function and transfer function 92
7.3 Harmonic input. Step input and step response 94
7.4 Energy transfer function 96
7.5 Power transfer. Random or periodic input 98

Chapter 8. RESPONSE OF A DAMPED HARMONIC OSCILLATOR TO A DRIVING FORCE 100
8.1 Introduction 100
8.2 Response to harmonic and impulse inputs 101
8.3 Damped harmonic driving force 103

Chapter 9. PASSIVE ELECTRIC CIRCUITS TREATED AS LINEAR SYSTEMS 107
9.1 Introduction 107
9.2 Two terminal L, R, C circuits 107
9.3 Ladder network filters 109
9.4 Transmission lines 113
9.5 Ideal distortionless filter 115
9.6 Low-pass filters 116
9.7 Band-pass filters 119

Chapter 10. THE RETRIEVAL OF INFORMATION FROM NOISE .. 121
10.1 Introduction 121
10.2 The integrator 122
10.3 The phase sensitive detector 125
10.4 The boxcar detector 126
10.5 The correlator 127
10.6 The Wiener–Hopf condition 131
10.7 The matched filter 135

Chapter 11. COHERENT DIFFRACTION AT PLANE APERTURES AND LENSES 138

11.1 Introduction 138
11.2 Co-ordinate system 139
11.3 Treatment based on the Huygens, Fresnel, Kirchhoff approach .. 140
11.4 Treatment based on the angular spectrum 142
11.5 Evanescent waves 143
11.6 Summary of results using the two methods 145
11.7 Power flow and intensity 147
11.8 Diffraction by one-dimensional apertures 148
11.9 Examples of one-dimensional systems. Babinet's principle.. .. 149
11.10 Examples of two-dimensional systems 154
11.11 The optical transfer and point spread functions 157
11.12 Diffraction at a lens 158

Chapter 12. OPTICAL COHERENCE AND HOLOGRAPHY 163

12.1 Introduction 163
12.2 The characterisation of coherence 165
12.3 Visibility of interference fringes 166
12.4 Effect of partially coherent illumination on diffraction patterns .. 168
12.5 The Hanbury Brown and Twiss experiment 169
12.6 The propagation of coherence 170
12.7 Holography – basic principle 172
12.8 Fourier versus Fresnel holography 176
12.9 Optical processing using holographic techniques 177

Chapter 13. X-RAY, NEUTRON AND ELECTRON DIFFRACTION FROM STATIONARY SCATTERERS 181

13.1 Introduction 181
13.2 Diffraction by an assembly of point scatterers 182
13.3 Scattering by a continuum 184
13.4 Cross-section. Scattering function 185
13.5 Density autocorrelation function 186
13.6 The pair correlation function 187
13.7 General comments 188
13.8 The atomic scattering factor 189
13.9 Diffraction by a crystal 190
13.10 Diffraction by liquids and amorphous materials 192
13.11 Density perturbations in a continuous medium 194
13.12 Harmonic distortion of an assembly of point scatterers. Debye–Waller factor 197
13.13 Random displacements of an assembly of point scatterers. Debye–Waller factor 198

Chapter 14. X-RAY, NEUTRON AND ELECTRON DIFFRACTION FROM TIME VARYING SYSTEMS.. 200

14.1 Basic equations 200
14.2 Other modifications for time dependent systems 202

14.3 The time dependent correlation function. Van Hove's formula .. 203
14.4 Density perturbations in a continuum. Brillouin scattering .. 206
14.5 Harmonic distortion of an assembly of point scatterers. Debye–Waller factor 209
14.6 Independent vibrations of an assembly of point scatterers 210
14.7 The self correlation function for a bound motion 211
14.8 Unbound motion. Diffusion 212

APPENDICES 215

Appendix A Evaluation of Fourier series coefficients 215
Appendix B Delta functions 216
Appendix C The Fourier integral inversion theorem 218
Appendix D Expressions for $FT^+\ FT^+\{f(x)\}$ and $FT^-\ FT^-\{f(x)\}$ 220
Appendix E Parseval's theorem 221
Appendix F The Schwartz inequality and the bandwidth theorem 222
Appendix G The product and convolution theorems 224
Appendix H Bessel functions 225
Appendix I Transforms of symmetrical functions in two and three dimensions 227
Appendix J The Wiener–Khintchine theorem 228
Appendix K The autocorrelation function of a stationary random function 230
Appendix L Spectrum and autocorrelation function for shot noise 230
Appendix M Random phase modulation 232
Appendix N Random telegraph signals 233
Appendix O The response of a linear system expressed in terms of impulse response.. 234
Appendix P Use of Kirchhoff's formula for diffraction at a plane aperture 235
Appendix Q Fresnel and Fraunhofer diffraction treated by the angular spectrum method 236
Appendix R Ghosts in diffraction from a distorted array of point scatterers 239
Appendix S The pair distribution function for randomly displaced scatterers.. 241
Appendix T Scattering by a time dependent system 242
Appendix U Implications of Causality 244

BIBLIOGRAPHY 247
