

Contents

1	System models	1
1.1	Motivation for implicit equations	2
1.1.1	Unification	2
1.1.2	Generality	2
	Improper systems	2
	Constrained inputs	2
	Constrained auxiliary variables	3
	Under-determined and over-determined systems	3
	Uncertainties	3
1.1.3	Large-scale systems	3
1.1.4	Simplicity	4
1.1.5	Non-oriented systems	4
1.2	Realizations	5
1.2.1	State-space models	5
1.2.2	Polynomial matrix-fraction models	5
1.2.3	Rational matrices	7
	Algebraic operations	7
	Column realizations	10
	Row realizations	11
1.3	Dual systems and realizations	12
1.4	Realization from input-output data	13
1.5	Notes and references	14
1.6	Further study	14
2	The Kronecker form	19
2.1	Transformation to Kronecker form	19
2.1.1	Blocks of the form L_{ϵ_i}	20
2.1.2	Blocks of the form $L_{\eta_i}^T$	21
2.1.3	Blocks of the form $I - \lambda J_{\delta_i}(0)$	21
2.1.4	Blocks of the form $J_{\gamma_i}(\lambda_i) - \lambda I$	22
2.1.5	Minimal systems	22
2.2	Notes and references	22
2.3	Further study	23

3	Analysis of singularities	25
3.1	Poles and zeros	25
3.1.1	The Kronecker form	26
3.1.2	Non-singular pencils	26
3.1.3	Minimal systems	27
3.2	Characteristic gains and frequencies	28
3.3	Gain and frequency matrices and pencils	30
3.3.1	Pole pencils	30
3.3.2	Zero pencils	32
3.3.3	The closed-loop system	32
3.3.4	Gain operators	33
3.4	Computation of poles and zeros	33
3.5	Notes and references	34
3.6	Further study	34
4	Systems of minimal dimension	37
4.1	System equivalence and minimality	38
4.1.1	The effect of initial conditions	39
4.2	Conditions for minimality	41
4.2.1	Property 1	42
4.2.2	A concrete subspace sequence	43
4.2.3	Property 2	45
4.2.4	Property 3	47
4.2.5	Property 4	49
4.2.6	Proof of minimality theorem 4.1	50
4.3	The permuted state-space form	51
4.3.1	The structure of non-minimal systems	51
4.4	A minimization algorithm	54
4.4.1	A small example	56
4.5	An alternative construction	60
4.5.1	An example	61
4.6	Notes and references	64
4.7	Further study	65
5	Canonical representations	67
5.1	Invariance, completeness, and independence	67
5.2	The case $n = 0$	68
5.3	Column canonical forms	69
5.3.1	Transformation T1	69
5.3.2	System parameterization	71
5.3.3	An example in T1 form	72
5.3.4	Direct computation of T1	72
5.3.5	The block companion form	73
5.3.6	Transformation T2	73

5.3.7	An example of T2	74
5.3.8	Transformation T3	75
5.3.9	An example of T3	75
5.3.10	The minimization example (continued)	75
5.3.11	An alternative transformation	76
5.3.12	Alternative transformation example	77
5.3.13	Parameter locations from T3	78
5.3.14	Canonical polynomial forms	79
	Example canonical polynomial form	79
5.4	Other canonical forms	79
5.5	Notes and references	79
5.6	Further study	80
6	Algebraic design applications	83
6.1	Combination of subsystems	84
6.1.1	Direct sum	84
6.1.2	Intersection	84
6.1.3	Permutation	85
	Inverse systems	85
6.1.4	Projection	85
6.1.5	Reduction	86
6.2	The algebraic design problem	86
6.2.1	Generalized design equations	87
	Observer example	88
6.2.2	The subspace inclusion requirement	89
6.3	Solution parameterization	90
	Case 1	91
	Case 2	92
	Case 3	93
	Observer example (continued)	94
6.4	Standard design configurations	94
6.4.1	Exact model matching	94
6.4.2	Feedback compensation with internal stability	96
6.5	Parametric design considerations	97
6.5.1	Row and column permutation	98
6.5.2	Cart and stick example	98
6.5.3	The closed-loop reduced system	100
6.5.4	Effective solution	102
6.5.5	Recursive design	102
	A recursive structure	103
6.5.6	Numerical considerations	104
6.6	Pole and zero placement	104
6.6.1	Stable factorization	104
6.6.2	Pole placement	106

6.6.3	Zero placement	107
	Root-locus design	107
6.6.4	Placement of finite zeros	109
	Effective zero placement	110
	Solution of effective zero placement	112
	The partition of y	113
	Excess inputs	113
	Zero placement example	114
	Summary	115
6.7	Notes and references	115
6.8	Further study	116
7	Optimization with quadratic cost	119
7.1	Optimization in continuous time	119
7.1.1	The state-space form	121
7.1.2	The optimal cost	122
7.1.3	Closed-loop solution	122
7.2	Discrete-time optimization	124
7.2.1	Discrete time state space systems	125
	Relation to continuous-time optimization	126
7.3	Filtering	127
7.4	Notes and references	129
7.5	Further study	129
8	System identification	131
8.1	System parameterization	131
8.2	Realization from input-output data (continued)	133
8.2.1	Sufficient excitation	135
8.2.2	Implementation	136
	The effect of initial values	136
	Finite memory	137
8.2.3	Approximate solution and structural parameter selection	137
8.3	Estimation of parameters	139
8.3.1	Estimation of covariances	140
8.4	Notes and references	141
8.5	Further study	141
9	Large-scale systems	143
9.1	Solution of operating points	144
9.2	Integration methods	145
9.2.1	Stiffness	146
9.2.2	Implicit equations	147
9.2.3	Higher-order methods	148
9.2.4	Vector equations	149

9.3	The Nyquist stability test for large systems	150
9.4	Continuation methods	151
9.5	Notes and references	153
9.6	Further study	154
10	Extensions	155
10.1	Multi-operator systems	155
10.2	Realizations	156
10.2.1	Binary operations	156
	Realization of scalars	156
	General multi-rational systems	157
10.3	Equivalence and minimality	158
10.4	Time-varying systems	159
10.5	Notes and references	160
10.6	Further study	160
