Preface to the English Edition	xi
Preface	xiii
Chapter I. Comparison Functions	1
I.1. Basic concepts of asymptotic methods	1
1. Symbols O , o , and \sim	1
2. Asymptotic series and their properties. Asymptotic ansatz	3
3. Properties of asymptotic expansions	5
I.2. The Airy functions and their asymptotics	7
1. The Airy equation. Standard solutions. Relations between solutions	7
2. Formal solutions of the Airy equation at infinity	10
3. Derivation of asymptotic expansion for the Airy function from integral representation at $ \arg z \leq 2\pi/3 - \varepsilon$	11
4. The Stokes phenomenon for the Airy equation	14
5. Justifying formal asymptotic solutions of the Airy equation by using integral equations	17
I.3. Parabolic cylinder functions and their asymptotics	21
1. The Weber equation. Standard solutions and relations between solutions	21
2. Asymptotics of the parabolic cylinder functions for large arguments	25
3. Modified parabolic cylinder functions and their asymptotics	30
I.4. The Bessel functions and their asymptotics	31
1. The Bessel equation. Standard solutions and relations between solutions	31
2. Asymptotics of cylinder functions for large arguments	32
3. Asymptotic solutions of the equation $y''(z) + [1/z + (1 - m^2)/(4z^2)]y(z) = 0$	35
4. The equation $w''(z) - az^mw(z) = 0$: Solutions and their asymptotics	37
I.5. Confluent hypergeometric function and its asymptotics	40
1. Confluent hypergeometric equation. The functions $\Phi(a, c, z)$ and $\Psi(a, c, z)$ and relations between them	40
2. Asymptotics of the functions $\Phi(a, c, z)$ and $\Psi(a, c, z)$	43
3. The Whittaker functions and their asymptotics	45
Comments	47

Chapter II. Derivation of Asymptotics	49
II.1. General theory	49
1. Reduction of second order equations to the canonical form	49
2. Formal theory for equations without transition points	50
3. The Liouville-Green transformation	56
II.2. Asymptotic solutions on the complex plane	59
1. Turning points, Stokes lines, canonical domains	59
2. Primary fundamental system of solutions in a canonical domain	62
3. Relation matrices	65
II.3. Method of comparison equations for equations with one transition point	69
1. Formal procedure of the method of comparison equations	69
2. Method of comparison equations for equations with one simple turning point	71
3. Asymptotics far from a turning point	73
4. Local asymptotic expansions near a turning point	76
5. Turning point of multiplicity m	77
6. Equations with one simple pole	80
II.4. Method of comparison equations for equations with two transition points	81
1. Formal analysis of equations with two simple turning points	81
2. Regularization of phase integrals	85
3. Formal analysis of equations with one simple turning point and one simple pole	90
II.5. Method of comparison equations for equations with close transition points	92
1. Scaling transformations	92
2. Two close turning points	94
3. Close pole and turning point	97
Comments	99
Chapter III. Physical Problems	101
III.1. The WKB method for bound states in quantum mechanics	101
1. Anharmonic oscillator. Highly excited states	101
2. Anharmonic oscillator. Small perturbations	107
3. Quantization for potentials Coulomb-type singularity	111
III.2. Normal modes in ocean waveguide	118
1. Formulation of the problem	118
2. Asymptotic formulas for normal modes and phase velocities	120
III.3. Exponential spectrum splitting	123
1. Two symmetric potential wells	123
2. Symmetric two-center problem	127
III.4. Quasistationary states	131
1. Stark effect in hydrogen	131
2. Ionization in electric field	134
III.5. One-dimensional scattering problem	136
1. Semiclassical asymptotics of the Jost functions and scattering phases for potentials with Coulomb singularity	136
2. Wave transition through a potential barrier	139

3. Overbarrier reflection	143
III.6. Band spectrum	147
1. Equations with periodic potential	147
2. Asymptotic formulas for bandwidths	149
3. The Mathieu equation	152
Comments	152
Chapter IV. Supplements	155
IV.1. Numerical realization of asymptotic methods	155
1. Approximation of potential and evaluation of phase integrals	155
2. Approximation of the derivatives of a potential at a point	158
IV.2. The Prüfer transformation and iterative modification of the WKB method	160
1. The Prüfer transformation	160
2. Iterative procedure for solving equations for amplitude and phase and its connection with asymptotic expansions	162
IV.3. Solutions of $z^2 w'' - (z^3 + a_2 z^2 + a_1 z + a_0)w = 0$	164
1. Standard solutions	164
2. Representation of solutions in terms of the Mellin-Barnes integrals	167
3. Connection between the solutions $I_a^{(j)}(z)$ and $K_a^{(k,r)}(z)$	174
4. Difference equation for connection factors	180
Comments	183
