|--|------------|
| <b>List of symbols</b>                                       | <b>xi</b>  |
| <b>1 Basic notions</b>                                       | <b>1</b>   |
| 1.1 General introduction                                     | 1          |
| 1.2 Laplace and Legendre–Fenchel transforms                  | 6          |
| 1.3 Large deviation property                                 | 10         |
| 1.4 Esscher tilting  | 11         |
| 1.5 Expansion of the characteristic function                 | 16         |
| 1.6 Bibliographical notes                                    | 22         |
| <b>2 Saddlepoint approximations for i.i.d. sums</b>          | <b>23</b>  |
| 2.1 Esscher functions  | 23         |
| 2.2 Classical saddlepoint approximations                     | 26         |
| 2.3 Proofs   | 31         |
| 2.4 Examples   | 38         |
| 2.5 Bibliographical notes                                    | 55         |
| <b>3 Asymptotic expansions of integrals</b>                  | <b>57</b>  |
| 3.1 Laplace’s method   | 57         |
| 3.2 Uniform asymptotic expansion                             | 66         |
| 3.3 Lugannani–Rice formula                                   | 74         |
| 3.4 Bibliographical notes                                    | 87         |
| <b>4 Transformation of the basic approximation</b>           | <b>89</b>  |
| 4.1 Marginal distributions                                   | 89         |
| 4.2 Estimating equations                                     | 104        |
| 4.3 Bibliographical notes                                    | 114        |
| <b>5 Tests in exponential families</b>                       | <b>115</b> |
| 5.1 The large deviation adjusted signed log likelihood ratio | 115        |
| 5.2 One-dimensional affine hypothesis                        | 118        |
| 5.3 A general one-dimensional hypothesis                     | 125        |
| 5.4 Bibliographical notes                                    | 141        |
| <b>6 Uniform saddlepoint approximations</b>                  | <b>143</b> |
| 6.1 General formulation                                      | 143        |
| 6.2 Log-concave densities                                    | 155        |
| 6.3 Gamma- or beta-like densities                            | 165        |

|                      |  |            |
|----------------------|--|------------|
| 6.4                  | The lattice case                                   | 171        |
| 6.5                  | Nonidentically distributed variables               | 176        |
| 6.6                  | Bibliographical notes                              | 183        |
| <b>7</b>             | <b>Compound sums</b>                               | <b>185</b> |
| 7.1                  | Introduction                                       | 185        |
| 7.2                  | Compound Poisson sum                               | 190        |
| 7.3                  | Generalizations of the compound Poisson sum        | 203        |
| 7.4                  | Compound Polya sums                                | 212        |
| 7.5                  | Simulations of rare events                         | 218        |
| 7.6                  | Bibliographical notes                              | 224        |
| <b>8</b>             | <b>Alternative approximations</b>                  | <b>226</b> |
| 8.1                  | Gamma-based approximations                         | 226        |
| 8.2                  | The ‘Box class’ of likelihood ratio criteria       | 234        |
| 8.3                  | Bibliographical notes                              | 239        |
| <b>9</b>             | <b>Markov chains</b>                               | <b>241</b> |
| 9.1                  | Tilted Markov kernel                               | 241        |
| 9.2                  | Expansion of the characteristic function           | 248        |
| 9.3                  | Results  | 258        |
| 9.4                  | The AR(1) process                                  | 268        |
| 9.5                  | Bibliographical notes                              | 276        |
| <b>10</b>            | <b>Nonstandard situations</b>                      | <b>277</b> |
| 10.1                 | Nonlattice and noncontinuous distributions         | 277        |
| 10.2                 | Daniels class                                      | 288        |
| 10.3                 | Ruin probabilities and waiting times               | 295        |
| 10.4                 | Tilting in the Poisson limit                       | 307        |
| 10.5                 | Bibliographical notes                              | 311        |
| <b>Appendix</b>      | <b>Algorithms</b>                                  | <b>313</b> |
| A.1                  | Normal distribution function and Esscher functions | 313        |
| A.2                  | Gamma function and its derivatives                 | 315        |
| A.3                  | Gamma distribution function                        | 316        |
