CONTENTS

I. ORTHOGONAL FUNCTIONS 1

1. Introduction, notation, definitions 1
2. The Riesz-Fischer theorem 5
3. The kernel of a system of orthonormal functions 8
4. Closed systems 10
5. Doubly orthogonal functions 14
6. A method of analytic continuation 18

II. THE KERNEL FUNCTION AND ASSOCIATED MINIMUM PROBLEMS 21

1. The kernel function 21
2. A general minimum problem 24

III. THE INVARIANT METRIC AND THE METHOD OF THE MINIMUM INTEGRAL 31

1. Introduction 31
2. The invariant metric 32
3. Simply-connected domains 34
4. General considerations 35
5. The curvature of the invariant metric 39

IV. KERNEL FUNCTIONS AND HILBERT SPACE 42

V. REPRESENTATION OF THE CLASSICAL DOMAIN FUNCTIONS 46

1. The Dirichlet integral and the classical functions 46
2. Orthogonal harmonic functions 49
3. Representation of Green's and Neumann's functions 52
4. Further identities involving the kernel function 59
5. Some further domain functions 62
6. The l-transforms 67
7. The eigenfunctions of the l-kernel 71
8. Discussion of the eigenfunctions 75
9. The space Λ_s and its kernel functions 80
10. Applications to the theory of univalent functions 86

VI. CANONICAL CONFORMAL TRANSFORMATIONS 89

1. Introduction 89
2. Representative domains 89
3. An extremal property of the domain S_4 95
4. Representation of canonical mapping functions in terms of the kernel function 99
5. Representative domains $R(B, t)$ 105

VII. ORTHOGONALIZATION OVER THE BOUNDARY 108

1. Definitions and elementary properties 108
2. An auxiliary extremal problem 110
3. Identification of the function $\hat{K}(z, \bar{\zeta})$ 114
4. Connections with the theory of bounded functions 117
5. Weighted kernels 120

VIII. VARIATIONAL METHODS 122

1. The Hadamard variational method 122
2. Properties of monotonicity of domain functions 127
3. The Schiffer variational method 130

IX. EXISTENCE PROOFS 138

X. PARTIAL DIFFERENTIAL EQUATIONS 144

1. Introduction 144
2. Orthogonal expansions for the Green's and Neumann's functions 151
3. Differential equations with non-definite coefficient 155
4. The equation of elasticity 160
5. Numerical evaluation of solutions of boundary value problems represented by the kernel function 164

XI. FUNCTIONS OF TWO COMPLEX VARIABLES AND PSEUDO-CONFORMAL MAPPING 166

1. Examples of domains and their visualization 166
2. Geometry of the space of two complex variables 170
3. Orthogonal functions of two complex variables 176
4. A metric invariant with respect to PCT's 182
5. Representative domains 187
6. Interior distinguished sets 194
7. The method of minimum integrals 198
8. The behavior of the kernel function $K_B(z, z)$ in the neighborhood of the boundary 203
9. Further bounds for the length of the line element of the invariant metric . . . 206

XII. GENERALIZATION OF POTENTIAL-THEORETICAL METHODS AND CERTAIN SUBCLASSES OF FUNCTIONS 211

1. Certain subclasses of functions $f(z_1, z_2)$ in domains with a distinguished boundary surface 211
2. Functions of the extended class 214
3. A generalized Poisson-Jensen formula for analytic polyhedra 216
4. The generalized Nevanlinna formula 219
5. Inequalities for certain functionals 221
6. A generalization of Fatou's theorem 224
7. Remark on functions of the extended class 228
8. Functions orthogonal with respect to the distinguished boundary surface . . . 229
