

NOTATION AND ABBREVIATIONS	1
I. BASIC CONCEPTS AND THEOREMS IN THE ANALYTIC THEORY OF QUASICONFORMAL MAPPINGS	3
1. The class of regular quasiconformal mappings and its closure	3
2. Differentiability	5
3. Distributional derivatives	7
4. The Beltrami differential equation	12
5. Two lemmas of M. Riesz	16
6. The Calderón-Zygmund inequality	24
7. A Tricomi singular integral equation and integrability of derivatives	31
8. A special case of the theorem on existence and uniqueness	34
9. Bojarski's proof for the general case	38
10. Extension to multiply connected domains	45
11. Some equivalent characterizations of quasiconformal mappings	48
II. THE PARAMETRICAL METHODS	53
12. Homotopical deformations of quasiconformal mappings and a lemma on asymptotic behaviour	53
13. Parametrization for mappings in the unit disc close to the identity mapping	57
14. The parametrical equation for mappings of the unit disc	63
15. The converse problem	67
16. Parametrization in an annulus	73
17. Teichmüller mappings and quasiconformal mappings with invariant boundary points in the unit disc	80
18. Extension to the case of an annulus	85
19. Line distortion under quasiconformal mappings	94
20. Area distortion under quasiconformal mappings	109

 Contents

	<u>page</u>
21. Parametrical methods for conformal mappings with quasiconformal extensions	116
22. Lehto's Majorant Principle and its applications	126
III. A REVIEW OF VARIATIONAL METHODS AND BASIC APPLICATIONS IN ELECTRICAL ENGINEERING	135
23. Belinskiĭ's variational method	135
24. A simple example of application	139
25. Schiffer's variational method	144
26. Extremal quasiconformal mappings. Teichmüller's theorem and applications	150
27. Basic applications in electrical engineering	155
