

# TABLE OF CONTENTS

<b>Preface</b>	xiii
<b>Notation</b>	xvii
<b>Chapter 1. Preliminary Information About Integration Theory</b>	<b>1</b>
§1. Notation and Terminology	1
1.1. Sets in $\mathbf{R}^n$	1
1.2. Classes of Functions in $\mathbf{R}^n$	3
§2. Some Auxiliary Information about Sets and Functions in $\mathbf{R}^n$	7
2.1. Averaging of Functions	7
2.2. The Whitney Partition Theorem	11
2.3. Partition of Unity	12
§3. General Information about Measures and Integrals	15
3.1. Notion of a Measure	15
3.2. Decompositions in the Sense of Hahn and Jordan	16
3.3. The Radon–Nikodym Theorem and the Lebesgue Decomposition of Measure	21
§4. Differentiation Theorems for Measures in $\mathbf{R}^n$	28
4.1. Definitions	28
4.2. The Vitali Covering Lemma	32
4.3. The $L_p$ -Continuity Theorem for Functions of the Class $L_{p,loc}$	33
4.4. The Differentiability Theorem for the Measure in $\mathbf{R}^n$	38
§5. Generalized Functions	39
5.1. Definition and Examples of Generalized Functions	39
5.2. Operations with Generalized Functions	42
5.3. Support of a Generalized Function. The Order of Singularity of a Generalized Function	46
5.4. The Generalized Function as a Derivative of the Usual Function. Averaging Operation	49
<b>Chapter 2. Functions with Generalized Derivatives</b>	<b>55</b>
§1. Sobolev-Type Integral Representations	55
1.1. Preliminary Remarks	55
1.2. Integral Representations in a Curvilinear Cone	60
1.3. Domains of the Class $J$	69
1.4. Integral Representations of Smooth Functions in Domains of the Class $J$	77

§2. Other Integral Representations	84
2.1. Sobolev-Type Integral Representations for Simple Domains	84
2.2. Differential Operators with the Complete Integrability Condition	96
2.3. Integral Representations of a Function in Terms of a System of Differential Operators with the Complete Integrability Condition	105
2.4. Integral Representations for the Deformation Tensor and for the Tensor of Conformal Deformation	108
§3. Estimates for Potential-Type Integrals	117
3.1. Preliminary Information	117
3.2. Lemma on the Compactness of Integral Operators	119
3.3. Basic Inequalities	121
§4. Classes of Functions with Generalized Derivatives	125
4.1. Definition and the Simplest Properties	125
4.2. Integral Representations for Elements of the Space $\overline{W}_{1,loc}^l$	125
4.3. The Imbedding Theorem	131
4.4. Corollaries of Theorem 4.2. Normalization of the Spaces $W_p^l(U)$	133
4.5. Approximation of Functions from $W_p^l$ by Smooth Functions	141
4.6. Change of Variables for Functions with Generalized Derivatives	148
4.7. Compactness of the Imbedding Operators	152
4.8. Estimates with a Small Coefficient for the Norm in $L_p^l$	158
4.9. Functions of One Variable	160
4.10. Differential Description of Convex Functions	162
4.11. Functions Satisfying the Lipschitz Condition	164
§5. Theorem on the Differentiability Almost Everywhere	167
5.1. Definitions	167
5.2. Auxiliary Propositions	170
5.3. The Main Result	171
5.4. Corollaries of the General Theorem on the Differentiability Almost Everywhere	173
5.5. The Behaviour of Functions of the Class $W_p^l$ on Almost All Planes of Smaller Dimensionality	179
5.6. The ACL-Classes	181
<b>Chapter 3. Nonlinear Capacity</b>	<b>182</b>
§1. Capacity Induced by a Linear Positive Operator	183
1.1. Definition and the Simplest Properties	183
1.2. Capacity as the Outer Measure	184
1.3. Sets of Zero Capacity	186
1.4. Extension of the Set of Admissible Functions	188
1.5. Extremal Function for Capacity	189
1.6. Comparison of Various Capacities	189
§2. The Classes $W(T, p, V)$	191
2.1. Definition of Classes	191

2.2. Theorems of Egorov and Luzin for Capacity	191
2.3. Dual $(T, p)$ -Capacity, $p > 1$ . Definition and Basic Properties	194
2.4. Calculation of Dual $(T, p)$ -Capacity	196
§3. Sets Measurable with Respect to Capacity	206
3.1. Definition and the Simplest Properties of Generalized Capacity	206
3.2. $(T, p)$ -Capacity as Generalized Capacity	206
§4. Variational Capacity	208
4.1. Definition of Variational Capacity	209
4.2. Comparison of Variational Capacity and $(T, p)$ -Capacity	212
4.3. Sets of Zero Variational Capacity	215
4.4. Examples of Variational Capacity	216
4.5. Refined Functions	216
4.6. Theorems of Imbedding into the Space of Continuous Functions	218
§5. Capacity in Sobolev Spaces	223
5.1. Three Types of Capacity	223
5.2. Extremal Functions for Capacity	226
5.3. Capacity and the Hausdorff $h$ -Measure	228
5.4. Sufficient Conditions for the Vanishing of $(l, p)$ -Capacity	232
§6. Estimates of $[l, p]$ -Capacity for Some Pairs of Sets	234
6.1. Estimates of Capacity for Spherical Domains	234
6.2. Estimates of Capacity for Pairs of Continuums Connecting Concentric Spheres	237
§7. Capacity in Besov–Nickolsky Spaces	240
7.1. Preliminary Information	240
7.2. Capacities in $b_{l,p,\theta,G,h}^1$ : Simplest Properties	241
7.3. Comparison of Capacity of a Pair of Points to Capacity of a Point Relative to a Complement of a Ball	242
7.4. Capacity of the Spherical Layer	243
<b>Chapter 4. Density of Extremal Functions in Sobolev Spaces with First Generalized Derivatives</b>	246
§1. Extremal Functions for $(1, p)$ -Capacity	247
1.1. Simplest Properties of Extremal Functions	247
1.2. The Dirichlet Problem and Extremal Functions	249
1.3. Extremal Functions for Pairs of Smooth Compacts	250
§2. Theorem on the Approximation of Functions from $L_p^1$ by Extremal Functions	253
2.1. Auxiliary Statements	253
2.2. The Class $Ext_p(G)$	254
2.3. Proof of the Theorem on Approximation	257
2.4. Representation in Form of a Series	263
§3. Removable Singularities for the Spaces $L_p^1(G)$	266
3.1. Two Ways of Describing Removable Singularities	266
3.2. Properties of $NC_p$ -Sets. Localization Principle	268

<b>Chapter 5. Change of Variables</b>	<b>272</b>
§1. Multiplicity of Mapping, Degree of Mapping, and Their Analogies	272
1.1. The Multiplicity Function of Mapping	272
1.2. The Approximate Differential	274
1.3. The $K$ -Differential	277
1.4. The Change of Variable Theorem for the Multiplicity Function	280
1.5. The Degree of Mapping	282
§2. The Change of Variable in the Integral for Mappings of Sobolev Spaces	284
2.1. The Change of Variable Theorem for Continuous Mappings of the Class $L_n^1$	284
2.2. The Linking Index	286
2.3. The Change of Variable Theorem for Discontinuous Mappings of the Class $L_n^1$	288
§3. Sufficient Conditions of Monotonicity and Continuity for the Approximation Functions of the Class $L_n^1$	290
§4. Invariance of the Spaces $L_p^1(G)(L_n^1(G))$ for Quasiisometric (Quasiconformal) Homeomorphisms	299
4.1. Preliminary Information on the Mappings	299
4.2. Differentiation of Composition	305
4.3. Representation of Operators Preserving the Order	307
<b>Chapter 6. Extension of Differentiable Functions</b>	<b>313</b>
§1. Arc Diameter Condition	313
1.1. Analysis of the Ahlfors Condition	313
1.2. The Arc Diameter Condition	314
1.3. Properties of Domains Satisfying the Arc Diameter Condition	315
§2. Necessary Extension Conditions for Seminormed Spaces	319
2.1. The Extension Operator. Capacitary Extension Condition	319
2.2. Additional Properties of Capacity	320
2.3. The Invisibility Condition	320
2.4. The Extension Theorem	322
2.5. Verification of the Conditions of the Theorem for the Spaces $L_p^l(G), W_p^l(G)$	326
§3. Necessary Extension Conditions for Sobolev Spaces	331
3.1. Necessary Extension Conditions for $L_p^l, W_p^l$ at $lp = n$	331
3.2. Necessary Conditions for $L_p^l, W_p^l$ at $1 \leq lp \leq 2$ in Plane Domains	335
3.3. Necessary Conditions Different from the Arc Diameter Condition	337
3.4. Refinement for the Space $W_p^l$	340
§4. Necessary Extension Conditions for Besov and Nickolsky Spaces	342
4.1. Extension Theorem for $lp > n$	342
4.2. Extension Conditions for $lp = n$	343

§5. Sufficient Extension Conditions	348
5.1. Quasiconformal Extension	348
5.2. Extension Conditions for Sobolev Classes	349
5.3. Example of Estimating the Norm of an Extension Operator	353
5.4. The Extension Condition for Nickolsky–Besov Spaces	354
