Introduction	v
Supplementary notational references	xv

Part I

Elementary theory of automorphic forms on a bounded domain

Chapter 1. General notions and examples	3
§ 1. General notions	3
§ 2. Elliptic modular functions	3
§ 3. The modular group and elliptic curves	8
Chapter 2. Analytic functions and analytic spaces	10
§ 1. Power series and analytic functions	10
§ 2. Analytic sets	12
§ 3. Structure of local analytic sets	15
§ 4. The normalization theorem	19
§ 5. The Remmert-Stein theorem	20
§ 6. The quotient of C^n by a finite linear group	20
Chapter 3. Holomorphic functions and mappings on a bounded domain	26
§ 1. Semi-norms and norms	26
§ 2. Bounded families of holomorphic functions	28
§ 3. The holomorphic automorphism group of D	29
§ 4. A uniqueness theorem of H. Cartan	31
Chapter 4. Analysis on domains in C^n	34
§ 1. Measure theory	34
§ 2. L^p -spaces on a domain	37
§ 3. The Bergmann kernel function	37
§ 4. Holomorphic completions	39
§ 5. Finding an orthonormal basis of H	41
Chapter 5. Automorphic forms on bounded domains	43

§ 1. The quotient of a bounded domain by a discrete group	43
§ 2. Automorphic forms and Poincaré series	43

Part II

Automorphic forms on a bounded symmetric domain
and analysis on a semi-simple Lie group

Chapter 6. Examples for algebraic groups	53
§ 1. Definitions for algebraic groups and arithmetic subgroups	53
§ 2. Some examples	54
§ 3. Further examples — the orthogonal group	58
§ 4. Again $GL(n)$ and $SL(n)$	72
§ 5. Examples continued — the symplectic group	72
§ 6. An exceptional domain	77
§ 7. Remarks	81
Chapter 7. Algebraic groups	82
§ 1. Basic definitions and theorems	82
§ 2. Representations and root systems	86
§ 3. Parabolic subgroups of G	88
§ 4. The Bruhat decomposition	90
§ 5. The Cartan and Iwasawa decompositions	91
§ 6. The p -adic Iwasawa and Cartan decompositions	96
§ 7. Harish-Chandra's realization of bounded symmetric domains	98
§ 8. Discrete groups acting on D	101
Chapter 8. Representations of compact groups	102
§ 1. Measure theory and convolution on a locally compact group	102
§ 2. Representations on a locally convex space	104
§ 3. The Peter-Weyl theorem	108
§ 4. Some applications	112
§ 5. The Frobenius reciprocity theorem	113
§ 6. A compact Lie group is algebraic	115
§ 7. Compact and algebraic Lie groups	117
§ 8. The Weyl character and dimension formulas	120

Chapter 9. Some work of Harish-Chandra	130
§ 1. The universal enveloping algebra	130
§ 2. Quasi-semi-simple modules	137
§ 3. The main result	140
§ 4. Representations of a Lie group on a locally convex, complete, linear space	149
§ 5. A lemma giving a lower bound for ω_ρ	157
§ 6. Convergence of Fourier series	161
§ 7. Hua's determination of an orthonormal basis of $\mathcal{O}^2(D)$	166
Chapter 10. Functional analysis for automorphic forms	169
§ 1. Lemmas on operator algebras	169
§ 2. Some further results	178
§ 3. L^p -spaces on G	182
Chapter 11. Construction of automorphic forms	186
§ 1. Poincaré series	186
§ 2. Godement's criterion for the convergence of Eisenstein series	193
§ 3. Poincaré-Eisenstein series	198
§ 4. Boundary components and partial Cayley trans- forms	200
§ 5. Fourier-Jacobi series	209
§ 6. Poincaré-Eisenstein series (cont'd)	219
§ 7. The Satake compactification	221

Part III

Some special topics

Chapter 12. Fourier coefficients of Eisenstein series	225
§ 1. Generalized gamma integrals	225
§ 2. Application of the Poisson summation formula	227
§ 3. Fourier coefficients of Eisenstein series	228
§ 4. Euler product expansion of the Fourier coefficients	232
§ 5. Eisenstein series on the adèle group	240
Chapter 13. Theta functions and automorphic forms	243
§ 1. The Poisson summation formula	243

§ 2. Quadratic forms and Siegel's main formula (definite case)	245
Bibliography.....	253
Index	259
