0.	Introduction	11
0.1.	Some types of integral transforms	11
0.2.	Complex notation of differential equations	13
Part I		
Construction of Integral operators		
1.	The Riemann transform	19
1.1.	Definition of the transform	19
1.1.1.	Motivation of the method	19
1.1.2.	Definition of the Riemann transform	20
1.1.3.	Definition of associated functions	32
1.2.	Existence of the Riemann transform	47
1.2.1.	Existence of the transform	47
1.2.2.	Remarks on the existence theorem	51
1.3.	Representation of the Riemann transform — Examples	52
1.3.1.	Two-dimensional equations	52
1.3.2.	Examples: self-adjoint equations	53
1.3.3.	Examples: non-self-adjoint equations	93
1.3.4.	Example: general differential equation of second order with constant coefficients	105
1.4.	Representation of the Riemann transform by integral transforms	109
1.4.1.	Cauchy-type integrals	109
1.4.2.	Examples	113
1.4.3.	Duhamel products	120
1.5.	Higher order equations	125
1.5.1.	Definition and existence of the Riemann transform	125
1.5.2.	Examples	127
2.	Other transforms	140
2.1.	Bergman's integral operator	140
2.1.1.	Construction of the transform	140
2.1.2.	Examples: Representation of the transform	147
2.2.	Relations to differential operators	154

Part II	
Application of Integral Operators	
3.	Plane problems 161
3.1.	Construction of particular solutions: transonic flow 161
3.2.	A correspondence principle 166
3.2.1.	Subsonic flow 166
3.2.2.	Filtration flow 175
3.3.	Boundary value problems 180
3.3.1.	First method: reduction to an integral equation 181
3.3.2.	Second method: reduction to a boundary value problem for a holomorphic function 187
3.3.3.	Third method: superposition of particular solutions 191
4.	Axially symmetric problems 193
4.1.	The equation 193
4.2.	Specialization of transforms to three-dimensional problems 194
4.2.1.	The transform 194
4.2.2.	Representation of the transform T 197
4.2.3.	Solution of a Dirichlet problem 212
4.2.4.	Conjugate functions 216
4.2.5.	The non-characteristic Cauchy problem for parabolic equations in one space variable 219
4.2.6.	Higher order equations and system of equations 221
4.3.	Formally two-dimensional problems 223
4.4.	Applications 224
4.4.1.	Axially symmetric flow of an incompressible fluid 224
4.4.2.	Torsion of axially symmetric bodies 231
4.5.	Singularities of generalized axially symmetric potentials 233
5.	Instationary process in the plane 237
5.1.	Pseudoparabolic equations 237
5.1.1.	An example: flows of a viscous fluid 237
5.1.2.	An initial boundary value problem for a pseudoparabolic equations 240
5.1.3.	Specialization: axially symmetric problems 247
5.2.	Approximation of parabolic equations by pseudoparabolic ones 250
6.	Boundary value problems for three-dimensional equations 256
6.1.	Construction of particular solutions 256
6.2.	Solution of boundary value problems 266
6.2.1.	Superposition of particular solutions 267
6.2.2.	Reduction to a boundary value problem for harmonic vectors 269
6.2.3.	Reduction to an integral equation 271
7.	Concluding remarks: non-linear equations 276

Appendix A. Notation of special functions	284
Appendix B. List of Riemann transforms — three-dimensional cases	286
Appendix C. Transformations of the Tricomi equation	288
Appendix D	289
