

Table of Contents

	Introduction	xi
I	First Steps to Non-Archimedean	1
	1. Non-Archimedean Number Fields	1
	2. Ultrametrics	4
	3. Fields of p -adic Numbers	6
	4. Extensions of Non-Archimedean Fields	12
	5. Normed and Locally-Convex Spaces	17
	6. Continuous, Differentiable and Analytic Functions . .	19
	7. The Mahler Theory of an Integration on the Ring of p -adic Integers	24
II	The Gauss, Lebesgue and Feynman Distributions Over Non-Archimedean Fields	31
	1. Analytic Functions over Non-Archimedean Fields . .	33
	2. Analytic Distributions, Gauss and Feynman Distribu- tions in a Finite-Dimensional Case	36
	3. Non-Archimedean Hilbert Space	43
	4. The Space $L_2(K^n, e^{- x ^2} dx)$ of Functions Square Summable with Respect to the Canonical Gaussian Distribution	46
	5. The Space $L_2(K^n, dx)$ of Functions Square Summable with Respect the Lebesgue Distribution	50
	6. The Space $F_2(Z^n, \gamma)$ of Analytic Functions Square Summable with Respect to the Canonical Complex Gaussian Dis- tribution	54

7.	Unboundedness of the p -adic Gaussian Distribution	55
8.	The Volkenborn (Uniform) Distribution	64
III	The Gauss and Feynman Distributions on Infinite-Dimensional Spaces over Non-Archimedean Fields	65
1.	Continuous Multilinear Forms	66
2.	Generalized Functions on Infinite-Dimensional Spaces	70
3.	Laplace Transformation on Infinite-Dimensional Spaces	76
4.	Linear Partial Differential Equations on Infinite-Dimensional Spaces	79
IV	Quantum Mechanics for Non-Archimedean Wave Functions	85
1.	Schrödinger and Bargmann–Fock Representations in Non-Archimedean Quantum Mechanics	87
2.	Non-Archimedean Quantum Statistical Mechanics	92
3.	The Theorems of the Existence and Uniqueness of Solution of Linear Partial Differential Equations on Non-Archimedean Spaces	93
4.	Solvability of the Schrödinger, Heisenberg and Liouville Equations in Non-Archimedean Mechanics	95
5.	Two Measurement Processes: a Scale with an Infinite Decrease of 1 and a Scale with an Infinite Increase of 1	96
6.	Non-Archimedean Cosmology	98
7.	Microcosm and the Non-Archimedean Structure of the Real Minkowski Space–Time	100
8.	Models with an Infinitely Large Number of Particles	102
9.	The p -adic Interpretation of Tachyons	104
V	Functional Integrals and the Quantization of Non-Archimedean Models with an Infinite Number of Degrees of Freedom	107
1.	Lagrange’s Formalism for a Non-Archimedean Scalar Boson Field	107

2.	The Gauss and Feynman Integrals for a Non-Archimedean Quantum Scalar Boson Field	111
3.	The Bargmann–Fock Representation	113
VI	The p-Adic-Valued Probability Measures	115
1.	p -Adic Frequency Theory of Probability	116
2.	Axiomatics on the Basis of Finite-Additive Measures	119
3.	Monna-Springer Theory of Integration with Respect to Non-Archimedean Valued Measures	123
4.	Measures Decreasing on the Infinity	127
5.	The Product of a Function and a Measure	129
6.	A Formula of an Exchange of Variables in the Integral of Monna-Springer with Respect to the Decreasing Measure	130
7.	p -adic Valued Probability Measures	134
8.	Bernoulli p -adic Valued Probabilities on the Ring of the q -adic Integers	147
9.	Biological Models Connected with the p -adic Valued Bernoulli Distributions	150
10.	A Limit Theorem for Sums of Independent Random Variables	153
11.	Discrete Probabilities. A p -adic Interpretation of St. Petersburg Paradox	155
VII	Statistical Stabilization with Respect to p-adic and Real Metrics	161
1.	p -Adic Statistical Simulation	162
2.	On a Definition of the p -adic Frequency Probability .	171
3.	What Can We Do with p -adic Probabilities?	177
4.	The First Step to the p -adic Theory of Information .	179
5.	A Probability Model of a p -adic Coin	180
6.	On the Kolmogorov Complexity of p -adic Random Sequences	186
7.	The Statistical Interpretation of Quantum Models with Wave Functions Assuming Values in the Quadratic Extensions of the Field of p -adic Numbers	190

VIII	The p-adic Valued Probability Distributions (Generalized Functions)	193
1.	Axiomatics	193
2.	Probability Distributions on Spaces of p -adic Sequences	197
3.	A Limit Theorem	203
4.	Convergence of Series of Independent Random Variables	205
5.	The p -adic White Noise. An Analogue of Hida's Calculus	207
IX	p-Adic Superanalysis	215
1.	Infinitely Generated p -adic Banach Superalgebras . .	217
2.	Spectral Properties	220
3.	Differential Calculus on the p -adic Banach Superspace	225
4.	p -Adic Supermanifolds	231
	Bibliographical Remarks	235
	Open Problems	239
	Appendix	241
1.	Expansion of Numbers in a Given Scale	241
2.	An Analogue of Newton's Method	244
3.	Non-Existence of Differential Maps from \mathbb{Q}_p to \mathbb{R} . .	246
	Bibliography	249
	Index	263
