

# CONTENTS

Foreword: instructions for use	V
1. Introduction	1
2. Distributions associated with the non-unitary principal series	11
3. Modular distributions	17
4. The principal series of $SL(2, \mathbb{R})$ and the Radon transform	25
5. Another look at the composition of Weyl symbols	33
6. The Roelcke–Selberg decomposition and the Radon transform	45
7. Recovering the Roelcke–Selberg coefficients of a function in $L^2(\Gamma \backslash \Pi)$	61
8. The “product” of two Eisenstein distributions	69
9. The Roelcke–Selberg expansion of the product of two Eisenstein series: the continuous part	77
10. A digression on Kloosterman sums	91
11. The Roelcke–Selberg expansion of the product of two Eisenstein series: the discrete part	97
12. The expansion of the Poisson bracket of two Eisenstein series	111
13. Automorphic distributions on $\mathbb{R}^2$	119
14. The Hecke decomposition of products or Poisson brackets of two Eisenstein series	131
15. A generating series of sorts for Maass cusp-forms	149
16. Some arithmetic distributions	163
17. Quantization, products and Poisson brackets	177
18. Moving to the forward light-cone: the Lax–Phillips theory revisited	191
19. Automorphic functions associated with quadratic $PSL(2, \mathbb{Z})$ -orbits in $P_1(\mathbb{R})$	213
20. Quadratic orbits: a dual problem	231
Index of notations: page 1	247
Index of notations: page 2	248
Subject index	249
