**Background from the theory of functions of real and of complex variables** . . . . . 1

Convex functions – Ridged functions – Order and type of entire functions – Functions analytic in an angle – Some representation theorems – Some classical results from the theory of functions of a complex variable.

**Chapter One. Fundamentals of distribution functions on the real line and their characteristic functions** . . . 15

Distribution functions on the real line – Characteristic functions of d.f.'s on the real line: basic properties – The three classical distribution types and the degenerate type – Infinitely divisible laws. The Lévy and other representations. Categorization of the Poisson spectrum – Lattice distributions.

**Chapter Two. Characteristic functions analytic in a strip** . . . . . 31

Analytic c.f.'s – C.f.'s analytic in a strip with the real axis as a boundary – Analytic properties of the c.f.'s of one-sided d.f.'s – Factorization of c.f.'s analytic in a strip – I.d.c.f.'s analytic in a strip – I.d.c.f.'s corresponding to one-sided d.f.'s.

**Chapter Three. Entire characteristic functions** . . . 51

The theorems of P. Lévy, G. Polya and B. Ramachandran on the order and the type of entire c.f.'s – Marcinkiewicz' theorem.

**Chapter Four. Factorization theorems concerning the three classical types of laws: the Normal, Poisson and Binomial** . . . . . 65

The Lévy-Cramér theorem – Raikov's theorem – Decomposition of a Binomial-type law – Decomposition of the convolution

PAGE

of a Normal and a Poisson-type law – Decomposition of the convolution of a Poisson-type and a Binomial-type law with the same maximum span – Additional remarks.

**Chapter Five. The class $I_0$ of infinitely divisible laws : the theorems of Linnik, Ostrovskii and Cramér** . . . 73

A (partial) proof of Linnik's theorem that a necessary condition for an i.d. law with Normal component to belong to $I_0$ is that it belong to the class $\mathscr{L}$ – Ostrovskii's sufficiency condition for members of $\mathscr{L}$ to belong to $I_0$ – A theorem of Cramér's and an extension thereof on i.d. laws with continuous Poisson spectrum not in $I_0$ – Ostrovskii's theorems on i.d. laws without Normal component and with bounded positive Poisson spectrum.

**Chapter Six. Further decomposition theorems** . . . 109

Six other decomposition theorems (motivated by Section 5.2) – Applications to finite convolutions of Poisson-type laws – Decomposition theorems and the summands of an infinite series of independent random variables converging almost surely to a random variable.

**Appendix to Chapter Six. Certain results of Yu. V. Linnik on decomposition of probability laws, and their relationship to theorems 6.1 to 6.6** . . . . . 7

Linnik's basic decomposition theorem on i.d. laws with bounded Poisson spectrum – Its applications to i.d. laws with Poisson spectrum 'rational to the right' of a point $b > 0$ and/or 'rational to the left' of a point $-a < 0$.

**Chapter Seven. $\alpha$-Decomposition of probability laws** 133

Summary of earlier results – The basic Linnik-Mamai denumerable $\alpha$-decomposition theorem – An extension thereof – Applications of these theorems to the probability laws covered by Chapters 4 to 6.

PAGE

**Chapter Eight. Characterization of probability laws through independence of statistics** . . . . . 159

The two basic theorems of A. A. Zinger on independence of polynomial statistics – The Darmois-Skitovich theorem and an extension thereof – The Geary-Lukacs theorem and a theorem of Linnik and Zinger – Allied regression problems.

**Appendix I. Proofs of some classical results** . . . 188

The uniqueness theorem – The continuity theorem – The Herglotz-Bochner theorem and F. Riesz' extension thereof.

**Appendix II.** . . . . . 196

Periodic Fourier-Stieltjes transforms of functions of bounded variation on the real line – Functions of bounded variation constant outside a finite interval : a theorem of G. Polya – Dugué's theorem on absolutely monotonic functions.
