

CONTENTS

I. THE PROBLEM	1
1. Local Smith form and partial multiplicities	1
2. The main problem	3
3. Jordan chains and partial multiplicities	5
4. Reduction to monic matrix polynomials	8
5. A matrix-vector differential equation	10
6. An equivalent matrix problem	11
7. Partial multiplicities for nonsquare-matrix functions and description of partial multiplicities by minors	14
8. The imbedding problem for matrix polynomials	16
9. Dual multiplicities and a survey of previous results	18
10. Main results	20
II. GENERALIZED SIGAL INEQUALITIES, PROOF PRINCIPLES AND PROOF TECHNIQUES	25
1. Description of the terminology and the necessity of Condition I(i).	25
2. An induction principle and three reduction principles	28
3. The restriction lemma	29
4. Special representations of a given product	33
5. Proofs for the principles from Section 2	38
6. The inversion principle	43

III. SYSTEM OF RULES	47
1. The generalized Sigal rules	47
2. The diagonal rules and the rules of coorder 2	48
3. Rules of type (I, J) , especially of order 2	51
IV. THE RESULTS FOR $r_m \leq 7$	58
1. The necessity and the reducibility of Conditions I	58
2. The sufficiency of Conditions I and II for $r_m \leq 7$	63
3. The necessity of Condition I(ii)(a) for $r_m \leq 7$	76
4. The superfluosness of Condition I(ii)(b) for $r_m \leq 7$	79
V. THE DESCRIPTION OF $\Delta(\alpha, \beta)$ IN SPECIAL CASES	83
1. The case $\beta_1 \leq 2$	83
2. The case $\beta_3 = 0$	86
3. The Rodman-Schaps theorem	91
Appendix: On the theory of dual multiplicities	97
