

CONTENTS

Editor's foreword to the Russian edition XIII

Chapter I

Fundamental concepts of functional analysis

1. Linear systems 1
Concept of a linear system 1. Linear dependence and independence 2.
Linear manifolds and convex sets 3.
2. Linear topological, metric, normed and Banach spaces . . . 3
Linear topological space 3. Locally convex space 5. Metric linear
space 6. Normed linear space 7. Examples of normed linear space
10. Completeness of metric spaces. Banach space 14. Compact
sets 16. Separable spaces 19.
3. Linear functionals 19
Concept of a linear functional. Hyperplane 19. Continuous linear
functionals 19. Extension of continuous linear functionals 20. Ex-
amples of linear functionals 21.
4. Conjugate spaces 22
Duality of linear systems 22. Conjugate space to a normed linear
space 23. Weak and weak* topology 27. Properties of a sphere in
a conjugate Banach space 28. Factor space and orthogonal comple-
ments 29. Reflexive Banach spaces 30.
5. Linear operators 31
Bounded linear operators 31. Examples of bounded linear operators.
Integral operators. Interpolation theorems 33. Convergence of a se-
quence of operators. 37. Inverse operators 38. Space of operators.
Ring of operators 39. Resolvent of a bounded linear operator. Spec-
trum 39. Completely continuous operators 43. Operators with an

everywhere dense domain of definition. Linear equations 47. Remark on complex spaces 51. Closed unbounded operators 48.

6. Spaces with a basis 51
 Completeness and minimality of a system of elements. 51. Concept of a basis 52. Criteria for bases 54. Unconditional bases 55. Stability of a basis 56.

Chapter II

Linear operators in Hilbert space

1. Abstract Hilbert space 57
 Concept of a Hilbert space 57. Examples of Hilbert spaces 57. Orthogonality. Projection onto a subspace 59. Linear functionals 60. Weak convergence 61. Orthonormal systems 61.
2. Bounded linear operators in a Hilbert space 63
 Bounded linear operators. Adjoint operators. Bilinear forms 63. Unitary operators 65. Self-adjoint operators 67. Self-adjoint completely continuous operators 68. Completely continuous operators 70. Projective operators 73.
3. Spectral expansion of self-adjoint operators 75
 Operations on self-adjoint operators 75. Resolution of the identity. The spectral function 77. Functions of a self-adjoint operator 78. Unbounded self-adjoint operators 79. Spectrum of a self-adjoint operator. 81. Theory of perturbations 82. Multiplicity of the spectrum of a self-adjoint operator 85. Generalized eigenvectors 88.
4. Symmetric operators 90
 Concept of a symmetric operator, deficiency indices 90. Self-adjoint extensions of symmetric operators 91. Self-adjoint extensions of semi-bounded operators 92. Dissipative extensions 95.
5. Ordinary differential operators 96
 Self-adjoint differential expressions 96. Regular case 98. Singular case 99. Criteria for self-adjointness of the operators A on $(-\infty, \infty)$. 101. Nature of the spectrum of self-adjoint extensions 102. Expansion in terms of eigenfunctions 102. Examples 105. Inverse Sturm-Liouville problem 107.

6. Elliptic differential operators of second order 108
 Self-adjoint elliptic differential expressions 108. Minimal and maximal operators. L-harmonic functions 109. Self-adjoint extensions corresponding to basic boundary value problems 110.
7. Hilbert scale of spaces 113
 Hilbert scale and its properties 113. Example of a Hilbert scale. The spaces $W \times 2$. 114. Operators in a Hilbert scale 116. Theorems about traces 117.

Chapter III

Linear differential equations in a Banach space

1. Linear equations with a bounded operator 119
 Linear equations of first order. Cauchy problem 119. Homogeneous equations with a constant operator 119. Case of a Hilbert space 121. Equations of second order 122. Homogeneous equation with a variable operator 122. Equations with a periodic operator 126. Non-homogeneous equations 127.
2. Equation with a constant unbounded operator. Semi-groups 129
 Cauchy problem 129. Uniformly correct Cauchy problem 130. Generating operator and its resolvent 132. Weakened Cauchy problem 134. Abstract parabolic equation. Analytic semi-groups 136. Reverse Cauchy problem 137. Equations in a Hilbert space 139. Examples of well posed problems for partial differential equations 142. Equations in a space with a basis. Continual integrals 147.
3. Equation with a variable unbounded operator 151
 Homogeneous equation 151. Case of an operator $A(t)$ with a variable domain of definition 153. Non-homogeneous equation 154. Fractional powers of operators 155.

Chapter IV

Nonlinear operator equations

Introductory remarks

1. Nonlinear operator and functionals 159
 Continuity and boundedness of an operator 159. Differentiability of

- a nonlinear operator 160. Integration of abstract functions 162. Urysohn operator in the spaces C and L_p . 164. Operator f 167. Hammerstein operator 167. Derivatives of higher order 168. Potential operators 170.
2. Existence of solutions 172
 Method of successive approximations 172. Principle of contractive mappings 173. Uniqueness of a solution 174. Equations with completely continuous operators. Schauder principle 175. Use of the theory of completely continuous vector fields 176. Variational method 179. Transformation of equations 179. Examples. Decomposition of operators 180.
3. Qualitative methods in the theory of branching of solutions 183
 Extension of solutions, implicit function theorem 184. Branch points 184. Points of bifurcation, linearization principle 186. Examples from mechanics 189. Equations with potential operators 193. Appearance of large solutions 194. Equation of branching 194. Construction of solutions in the form of a series 195.

Chapter V

Operators in spaces with a cone

1. Cones in linear spaces 198
 Cone in a linear system 198. Partially ordered spaces 199. Vector lattices, minihedral cones 200. K -spaces 201. Cones in a Banach space 202. Regular cones 204. Theorems on the realization of partially ordered spaces 206.
2. Positive linear functionals 206
 Positive functionals 206. Extension of positive linear functionals 208.
3. Positive linear operators 210
 Concept of a positive operator 210. Uniformly positive functionals 209. Bounded functionals on a cone 209. Affirmative eigenvalues 211. Positive operators on a minihedral cone 213. Non-homogeneous linear equation 215. Invariant functionals and eigen-vectors of conjugate operators 215. Inconsistent inequalities 216.
4. Nonlinear operators 217
 Basic concepts 217. Existence of positive solutions 218. Existence

of a non-zero positive solution 219. Concave operators 220. Convergence of successive approximations 221.

Chapter VI

Commutative normed rings

1. Basic concepts 222
 Commutative normed rings 222. Examples of normed rings 222. Normed fields 225. Maximal ideals and multiplicative functionals 225. Maximal ideal space 227. Ring boundary of the space M . 228. Analytic functions on a ring 228. Invariant subspace of R . 230. Rings with involution 230.
2. Group rings. Harmonic analysis 231
 Group rings 231. The characters of a discrete group and maximal ideals of a group ring 233. Compact groups. Principle of duality 235. Locally compact groups 236. Fourier transforms 237. Hypercomplex systems 238.
3. Regular rings 239
 Regular ring 239. Closed ideals 241. The ring $C(S)$ and its subrings 241.

Chapter VII

Operators of quantum mechanics

1. General statements of quantum mechanics 243
 State and physical magnitudes of a quantum-mechanical system 243. Representations of algebraic systems 243. Coordinates and impulses 244. Energy operator. Schrödinger equation 246. Concrete quantum-mechanical systems 248. Transition from quantum mechanics to classical mechanics. 249.
2. Self-adjointness and the spectrum of the energy operator. . 252
 Criterion for self-adjointness 252. Nature of the spectrum of a radial Schrödinger operator 253. Nature of the spectrum of a one-dimensional Schrödinger operator 255. Nature of the spectrum of a three-dimensional Schrödinger operator 255.
3. Discrete spectrum, eigenfunctions 257
 Exact solutions 257. General properties of the solutions of the

- Schrödinger equation 260. Quasi-classical approximation for solutions of the one-dimensional Schrödinger equation. 261. Calculation of eigenvalues in one-dimensional and radial-symmetric cases 264. Perturbation theory 266.
4. Solution of the Cauchy problem for the Schrödinger equation 268
 General information 268. Theory of perturbations 269. Physical interpretation 270. Quasi-classical asymptotics of the Green's function 271. Passage to the limit as $h \rightarrow 0$. 273. Quasi-classical asymptotics of a solution of the Dirac equation 274.
5. Continuous spectrum of the energy operator and the problem of scattering 277
 Formulation of the problem 278. Basis for the formulation of the problem and its solution 279. Amplitude of scattering and its equation. 281. Case of spherical symmetry 282. General case 284. Inverse problem of the theory of scattering 285.

Chapter VIII

Generalized functions

1. Generalized functions and operations on them 288
 Introductory remarks 288. Notation 289. Generalized functions 290. Operations on generalized functions 292. Differentiation and integration of generalized functions. 293. Limit of a sequence of generalized functions 295. Local properties of generalized functions. 297. Direct product of generalized functions 298. Convolution of generalized functions 299. General form of generalized functions. 301. Kernel theorem 302.
2. Generalized functions and divergent integrals. 302
 Regularization of divergent integrals 302. Regularization of the functions x_+^λ , x_-^λ , x^{-n} and their linear combinations 305. Regularization of functions with algebraic singularities 308. Regularization on a finite segment 310. Regularization at infinity 312. Non-canonical regularizations 313. Generalized functions x_+^λ ; x_-^λ , and functions which are analogous to them as function of the parameter λ . 316. Homogeneous generalized functions 319. Table of derivatives of some generalized functions 320. Differentiation and integration of arbitrary order 321. Expression of some special functions in the form of derivatives of fractional order 322.

3.	Some generalized functions of several variables	323
	The generalized function r^λ . 323. Generalized functions connected with quadratic forms 326. Generalized functions $(P + i0)^\lambda$ and $(P - i0)^\lambda$. 328. Generalized functions of the form $\mathcal{P}f(\mathcal{P}, \lambda)$. 329. Generalized functions on smooth surfaces 331.	
4.	Fourier transformation of generalized functions	334
	The space S and generalized functions of exponential growth 334. Fourier transformation of generalized functions of exponential growth 335. Fourier transformations of arbitrary generalized functions 337. Table of Fourier transforms of generalized functions of one variable 338. Positive definite generalized functions 349.	
5.	Radon transformation	350
	Radon transformation of test functions and its properties 350. Radon transformation of generalized functions 351. Table of Radon transforms of some generalized functions in an odd-dimensional space 330.	
6.	Generalized functions and differential equations	359
	Fundamental solutions 359. Fundamental solutions for some differential equations 362. Construction of fundamental solutions for elliptic equations 363. Fundamental solutions of homogeneous regular equations 366. Fundamental solution of the Cauchy problem 367.	
7.	Generalized functions in a complex space	370
	Generalized functions of one complex variable 370. Generalized functions of m complex variables 374.	
	Bibliography	379
	Index of literature according to chapters	382
