Foreword	iii
Conference Participants	v
FUNCTIONAL ANALYSIS, NONLINEAR DIFFERENTIAL EQUATIONS, AND THE ALTERNATIVE METHOD	1
Lamberto Cesari	
Section 1. The Alternative Method	1
1. Introduction	1
2. The alternative scheme	2
3. The selfadjoint case. General reduction to an alternative problem by contraction maps	11
4. An analysis of auxiliary and bifurcation equations for the problem of periodic solutions	15
5. General reduction to an alternative problem by contraction maps in the nonselfadjoint case	23
Section 2. Problems of Perturbation for Ordinary Differential Equations	29
6. Boundary value problems for ordinary differential equations	29
7. The linear problem. Basic statements	32
8. The projection operators P and Q , and the partial inverse operator H	34
9. The perturbation problem	39
10. Examples	44
11. Some results for periodic solutions of certain typical systems	47
12. Symmetries and families of solutions	49

Section 3.	Problems of Perturbation for Partial Differential Equations	56
13.	Boundary value problems for partial differential equations	56
14.	The linear problem. Sobolev spaces. Basic statements	57
15.	The operators P , Q and H	60
16.	Problems of perturbation: the auxiliary equation	62
17.	The bifurcation equation, and examples	66
Section 4.	A Numerical Viewpoint and Error Bound Estimates	69
18.	Error estimates and existence of an exact solution	69
19.	Examples, and a method of successive approximations	75
Section 5.	Solutions in the Large of Liénard Systems with Forcing Terms	80
20.	Introductory remarks	80
21.	Formulation of the main theorems	83
22.	The canonic decomposition	86
23.	The operators J , J^*	88
24.	A topological degree argument and the Borsuk-Ulam theorem	90
25.	Proof of parts (a) and (b) of Theorem (21.i)	94
26.	Proof of part (c) of Theorem (21.i)	101
27.	Proof of parts (d) and (e) of Theorem (21.i)	103
Section 6.	The Alternative Method With Monotone Operators	104
28.	Monotone and maximal monotone operators	104
29.	The auxiliary equation and monotone maps	107

30.	The bifurcation equation and monotone maps	110
31.	Two statements for the nonresonance case	116
32.	Schauder's principle of invariance of domain	117
33.	The auxiliary equation and Schauder's principle	118
Section 7.	Elliptic Problems at Resonance in the Large	122
34.	Two abstract alternative statements	122
35.	One more existence theorem at resonance	129
36.	Existence of solutions across a point of resonance	131
37.	Extensions to nonselfadjoint problems	138
38.	Some theorems in the uniform topology	141
39.	Applications to problems of oscillation at resonance	143
40.	Linear elliptic operators in R^V	148
41.	A nonlinear Dirichlet problem at resonance	152
42.	More on nonlinear Dirichlet problems at resonance	154
Section 8.	Hyperbolic Partial Differential Equations	163
43.	Work of Cesari on doubly periodic solutions of the canonic hyperbolic equation and related plane wave equation	163
44.	Work of Hale on doubly periodic solutions of the plane wave equation	168
45.	Periodicity in only one variable	172
46.	Work of Petrovanu on periodic solutions of the canonic hyperbolic equation in R^3 and the Tricomi problem	174
47.	Work of Haimovici on problems whose unknowns are set functions	176

48. The work of Hecquet	177
49. The work of Hall	178
50. Other work	180
Bibliography	182
Selected references on the alternative method [1-125]	182
Other references [126-207]	191
APPLICATIONS OF GENERIC BIFURCATION	199
Shui-Nee Chow and John Mallet-Paret	
PERTURBATION METHODS FOR NONLINEAR PROBLEMS AT RESONANCE	209
Rangachary Kannan	
1. Introduction	209
2. The general problem of nonlinear perturbation at resonance	210
3. Brief survey of preliminary results	211
4. Landesman and Lazer's result	213
5. Outline of proof by "alternative problems"	215
6. Hess's proof of Theorem 1	216
7. An abstract generalization due to De Figueiredo	218
8. Remarks	221
References	224
MEASURABILITY OF SOLUTIONS OF NONLINEAR EQUATIONS	227
Rangachary Kannan and Habib Salehi	
1. Introduction	227
2. Preliminaries	228
3. Joint measurability	232
4. Stochastic models	234
References	243

SOME MATHEMATICAL PROBLEMS FROM PLATE AND SHELL THEORY	245
George H. Knightly	
1. Introduction	245
2. Formulation of the operator equation	246
3. Existence	252
4. Branching	255
5. Branching in the plate and shell problems	260
References	266
SOME RESONANCE PROBLEMS FOR ELLIPTIC BOUNDARY VALUE PROBLEMS	269
Alan C. Lazer	
1. Introduction	269
2. An introductory example	271
3. A functional analytic approach and the role of the alternative method	273
4. An elliptic boundary value problem	277
5. A critical point principle	281
6. Further related results	286
References	288
EXPOSITORY INTRODUCTION TO SOME ASPECTS OF DEGREE THEORY	291
Erich H. Rothe	
1. Introduction	291
2. The finite dimension case	292
3. The generalized mapping degree	300
4. The theorem of Poincaré-Bohl and its consequences	306

5. Application to monotone mappings	311
References	316
BOUNDARY VALUE PROBLEMS FOR $x'' = f(t, x, x')$ AND NONLINEAR FUNCTIONAL ANALYSIS	319
Jerry D. Schuur	
1. Introduction	319
2. The Picard problem in $C^1[0,1]$	320
3. The periodic problem in $C^1[0,1]$	326
4. The periodic problem in $L^2[0,1]$	330
Bibliography	336
A NONLINEAR ELLIPTIC BOUNDARY VALUE PROBLEM	339
Howard Shaw	
1. Introduction and preliminaries	339
2. Proof of the theorem	340
3. Remarks	343
Bibliography	346
CHOOSING PROJECTION OPERATORS FOR THE ALTERNATIVE METHOD	347
Daniel Sweet	
1. Introduction	347
2. The general theory	348
3. Periodic solutions for ordinary differential equations	349
Bibliography	352
