Preface

Notation and conventions

Dependence chart

Part I: Topology

1. Basic concepts	1
2. Metric and normed spaces	14
3. Further elementary theory	28
4. Separation properties	39
5. Connected spaces	47
6. Bases of neighbourhoods and open sets; countability axioms	53
7. Finite products	61
8. Complete metric spaces	67
9. Compactness	82
10. Properties related to compactness	96
11. Compact and totally bounded metric spaces	104
12. Existence of continuous real functions	111
13. More about connectedness	126
14. Infinite products	133
15. The Cantor space	141

Part II: Normed Linear Spaces

16. Elementary theory	148
17. Some particular spaces	158
18. Linear mappings	168
19. Linear functionals	187
20. Finite-dimensional spaces	195
21. Convexity	203
22. Convex series, closed-graph theorems	212
23. Extension and separation theorems	222
24. Dual spaces	237
25. Constructions giving new spaces	248
26. Spaces of continuous functions	261
27. Weak topologies	280
28. Tychonoff's theorem and its applications	294
29. Complemented subspaces	305
30. Bases	322
31. Unconditional convergence	339
32. Hilbert spaces	352
33. Linear lattices	364
34. Compact linear mappings	377
35. The duality of pairs of subspaces	389
Appendix 1: Countability	394
Appendix 2: Zorn's lemma	398
Symbols introduced in the text	402
Bibliography	404
Index	405
