Preface	xiii
Chapter I. Preliminaries	1
§1 Trace class and Hilbert-Schmidt operators	1
§2 Some topologies on $\mathcal{B}(\mathcal{H})$	10
§3 Isometries	13
§4 The unilateral shift of multiplicity 1	18
§5 Direct sums	24
§6 Shifts of higher multiplicity	26
Chapter II. Subnormal Operators: The Elementary Theory	27
§1 Definition and examples	27
§2 Pure operators and the minimal normal extension	37
§3 Quasinormal operators	43
§4 Hyponormal operators	46
§5 Cyclic subnormal operators	50
§6 Weighted shifts	53
§7 Bounded point evaluations	61
§8 Bergman operators	66
§9 Spectral sets	75
§10 The commutant of a subnormal operator	79
§11 The restriction algebra and the functional calculus	85
§12 The $C^*$ -algebra generated by a subnormal operator	88
§13 Unitary equivalence, similarity, and quasisimilarity	93
Chapter III. Function Theory On The Unit Circle	99
§1 Cesàro sums	99
§2 Convolution on the circle	103
§3 Harmonic functions on the disk	105
§4 Fatou's Theorem	108
§5 Subharmonic functions	114
§6 Hardy spaces	117
§7 The Nevanlinna class	120
§8 Factorization of functions in Nevanlinna class	125

§9 The disk algebra	132
§10 The invariant subspace lattice of the unilateral shift	135
§11 Weak-star closed ideals in $H^\infty$	140
§12 Szegő's Theorem	141
§13 Analytic Toeplitz operators	145
<b>Chapter IV. Hyponormal Operators</b>	<b>149</b>
§1 The real part of a hyponormal operator	150
§2 The Berger-Shaw Theorem	152
§3 The area of the spectrum of a hyponormal operator	156
§4 The self-commutator of the Bergman operator	156
§5 The decomposition of essentially normal operators	158
<b>Chapter V. Uniform Rational Approximation</b>	<b>163</b>
§1 Function algebras: examples and elementary properties	163
§2 Distributions and some results from analysis	166
§3 The Cauchy transform	173
§4 Invariant subspaces for subnormal operators	181
§5 Vitushkin localization operators	184
§6 $T$ -invariant algebras	187
§7 The Shilov boundary	190
§8 Representing measures	193
§9 Harmonic measure	196
§10 Hardy spaces for an arbitrary region	203
§11 Peak points	211
§12 Capacity	216
§13 Some applications of analytic capacity	222
§14 Dirichlet algebras	226
§15 Gleason parts	234
§16 The Wermer Embedding Theorem	239
§17 Bands of measures	244
§18 Annihilating measures	250
§19 Mergelyan's Theorem	253
§20 The double dual of a $T$ -invariant algebra	254
§21 The Lautzenheiser-Mlak Theorem	260
§22 Davie's Theorem	266
<b>Chapter VI. Weak-Star Rational Approximation</b>	<b>277</b>
§1 Weak-star closed subalgebras of $L^\infty(\mu)$	277
§2 The envelope	282
§3 Chaumat's Theorem	287
§4 $H^\infty(\partial K)$ for a Dirichlet algebra	291
§5 Dirichlet algebras revisited	296
§6 The weak-star closure of a Dirichlet algebra	298
§7 The weak-star closure of the polynomials	301

Chapter VII. Some Structure Theory For Subnormal Operators	309
§1 A decomposition of subnormal operators	309
§2 The minimal normal extension problem for subnormal operators	315
§3 Spectral mapping theorems	324
§4 Spectral mapping theorems for the essential spectrum	333
§5 A factorization theorem	341
§6 An infinite factorization theorem	352
§7 Full analytic subspaces	357
§8 Reflexivity for subnormal operators	361
§9 Filling in the holes of the spectrum of a normal operator	365
§10 Quasismilarity revisited	368
Chapter VIII. Bounded Point Evaluations	375
§1 A coloring scheme	375
§2 A sufficient condition for the existence of bounded point evaluations	384
§3 Heavy barriers exist	389
§4 Bounded point evaluations exist	397
§5 Thomson's Theorem	399
§6 Some applications of Thomson's Theorem	407
Epilogue	409
Bibliography	411
Index	431
List of symbols	435
