Introduction. What This Book is About	1
Chapter 0. Extended Introduction	3
§1. General outline	3
§2. Basic examples of physical systems	4
§3. Infinite systems and the thermodynamic limit	11
§4. Expansion of Heisenberg dynamics	15
§5. Euclidean approach	17
§6. Corpuscular picture (quasiparticles and scattering theory for infinite quantum systems)	23
Chapter 1. Construction of a Nonequilibrium Dynamics	27
§1. The dynamics of an infinite one-dimensional classical gas of interacting solid rods	27
§2. A quick review of $C^*$ -algebras	33
§3. Fock spaces and second-quantization operators	37
§4. The CAR algebra and its free dynamics. Dynamics of a system of interacting fermions. Analog of Robinson's theorem	44
§5. Linear dynamics for fermion and boson systems	53
§6. Random dynamics (stochastic Langevin equations)	58
§7. Marginally closed Markov chains with local interaction	67
Chapter 2. Construction of an Equilibrium Dynamics	79
§1. Ground and temperature states	79
§2. Ground state for an infinite system of harmonic oscillators	85
§3. A free quasistate	88
§4. Fock representation for the dynamics of free systems	96
§5. The Euclidean approach	102
§6. Euclidean fields for temperature states. The modular operator	130
Chapter 3. Spectral Analysis of the Euclidean Field Transfer Matrix	139
§1. Cluster expansion of the transfer matrix	140
§2. Cluster operators. Definition and basic properties	148
§3. Invariant $k$ -particle subspaces of a cluster operator	156
§4. Some examples	168
§5. Spectral analysis of the transfer matrix for a fermion field	184
§6. Continuous-time models	194
§7. Spectral analysis of $k$ -particle cluster operators	197
§8. Asymptotic decay of the correlation functions for Gibbs fields	208

<b>Chapter 4. Asymptotic Completeness for Interacting Fermion Systems</b>	<b>211</b>
§1. Fermi systems with bounded interaction	212
§2. Asymptotic completeness for interactions with vacuum polarization (linked cluster theorem)	227
§3. Fermi gas interacting weakly with a particle	242
§4. Weak-interaction limit for a quantum Schrödinger particle interacting with Fermi gas	254
<b>Chapter 5. The Method of Bethe-Salpeter Kernels (Dyson's Equation)</b>	<b>259</b>
§1. The Dyson equation and the Bethe-Salpeter kernel method for the Ising field	259
§2. One-particle spectrum of the transfer matrix for a Gibbs field with un- bounded spin. Description of the model and results	266
§3. Cluster expansion of the covariance operators	269
§4. Dyson's equation for the covariance operators	275
§5. Analytic structure of the Green functions	284
<b>Guide to the Literature</b>	<b>293</b>
