

TABLE OF CONTENTS

PREFACE	v
CHAPTER 1. BACKGROUND MATERIAL AND BASIC IDEAS	
1. Introduction	1
2. Distribution theory	3
3. Fourier analysis	8
4. Basic transmutations	14
5. Parseval formulas via transmutation and the generalized spectral function	21
6. Spectral theory in the energy variable	29
7. Spectral theory in the momentum variable	37
8. Classical spectral theory and relations to full line scattering	47
9. Introduction to singular operators and special functions	58
10. Paley-Wiener theorems, spherical transforms, and Parseval formulas for singular operators	69
11. Explicit constructions of generalized translations and transmutations for singular operators	80
12. Canonical formulation of Parseval formulas and transforms	90
CHAPTER 2. PATTERNS AND STRUCTURE	
1. Introduction	103
2. Spectral pairings for generalized translation and transmutation kernels	105
3. The general extended Gelfand-Levitan equation	117
4. Quantum scattering theory	126
5. The Marcenko equation via transmutation	136
6. The Marcenko equation for Fourier type operators	147
7. Minimization as a directive in characterizing transmutation kernels	159
8. Construction of transmutations for \tilde{Q} type operators	171
9. The Bergman-Gilbert (B-G) operator and generating functions	187
10. Orthogonal polynomials and transmutation	208

11. Relations between kernels and potentials	220
--	-----

CHAPTER 3. APPLICATIONS

1. Introduction	229
2. Probability theory and random processes	230
3. Linear stochastic estimation	237
4. Filtering and integral equations	244
5. Innovations and scattering	252
6. Transmutation and linear stochastic estimation	259
7. Random fields and singular operators	270
8. Geophysical inverse problems (reflection data)	275
9. Geophysical inverse problems (transmission data)	288
10. Some miscellaneous topics	300
11. Equations with operator coefficients	308
