Series Editor's Preface	v
Preface	vii
Part one. Sturm-Liouville operators	1
1 Spectral theory in the regular case	3
1.1 Basic properties of the operator	3
1.2 Asymptotic behaviour of the eigenvalues and eigenfunctions	5
1.3 Sturm theory on the zeros of solutions	12
1.4 The periodic and the semi-periodic problem	16
1.5 Proof of the expansion theorem by the method of integral equations .	24
1.6 Proof of the expansion theorem in the periodic case	31
1.7 Proof of the expansion theorem by the method of contour integration	33
2 Spectral theory in the singular case	38
2.1 The Parseval equation on the half-line	38
2.2 The limit-circle and limit-point cases	44
2.3 Integral representation of the resolvent	49
2.4 The Weyl-Titchmarsh function	55
2.5 Proof of the Parseval equation in the case of the whole line	59
2.6 Floquet (Bloch) solutions	66
2.7 Eigenfunction expansion in the case of a periodic potential	69
3 The study of the spectrum	74
3.1 Discrete, or point, spectrum	74
3.2 The spectrum in the case of a summable potential	77
3.3 Transformation of the basic equation	84
3.4 The study of the spectrum as $q(x) \rightarrow -\infty$	86
4 The distribution of the eigenvalues	92
4.1 The integral equation for Green's function	92
4.2 The first derivative of the function $G(x, \eta; \mu)$	97
4.3 The second derivative of the function $G(x, \eta; \mu)$	99

4.4	Further properties of the function $G(x, \eta; \mu)$	101
4.5	Differentiation of Green's function with respect to its parameter	103
4.6	Asymptotic distribution of the eigenvalues	108
4.7	Eigenfunction expansions with unbounded potential	114
5	Sharpening the asymptotic behaviour of the eigenvalues and the trace formulas	118
5.1	Asymptotic formulas for special solutions	118
5.2	Asymptotic formulas for the eigenvalues	119
5.3	Calculation of the sums $S_k(t)$	122
5.4	Another trace regularization—auxiliary lemmas	124
5.5	The regularized trace formula for the periodic problem	129
5.6	The regularized first trace formula in the case of separated boundary conditions	133
6	Inverse problems	139
6.1	Definition and simplest properties of transformation operators	139
6.2	Transformation operators with boundary condition at $x = 0$	140
6.3	Derivation of the basic integral equation	145
6.4	Solvability of the basic integral equation	150
6.5	Derivation of the differential equation	153
6.6	Derivation of the Parseval equation	155
6.7	Generalization of the basic integral equation	160
6.8	The case of the zero boundary condition	162
6.9	Reconstructing the classical problem	164
6.10	Inverse periodic problem	168
6.11	Determination of the regular operator from two spectra	171
	Part two. One-dimensional Dirac operators	183
7	Spectral theory in the regular case	185
7.1	Definition of the operator—basic properties	185
7.2	Asymptotic formulas for the eigenvalues and for the vector-valued eigenfunctions	188
7.3	Proof of the expansion theorem by the method of integral equations	193
7.4	Periodic and semi-periodic problems	201
7.5	Trace calculation	207
8	Spectral theory in the singular case	213
8.1	Proof of the Parseval equation on the half-line	213
8.2	The limit-circle and the limit-point cases	217
8.3	Integral representation of the resolvent. The formulas for the functions $\rho(\lambda)$ and $m(z)$	222

8.4	Proof of the expansion theorem in the case of the whole line	228
8.5	Floquet (Bloch) solutions	234
8.6	The self-adjointness of the Dirac systems	236
9	The study of the spectrum	243
9.1	The spectrum in the case of summable coefficients	243
9.2	Transformation of the basic system	247
9.3	The case of a pure point spectrum	251
9.4	Other cases	256
10	The solution of the Cauchy problem for the nonstationary Dirac system	259
10.1	Derivation of the formula for the solution of the Cauchy problem . . .	259
10.2	The Goursat problem for the solution kernel of the Cauchy problem .	263
10.3	The transformation matrix operator	265
10.4	Solution of the mixed problem on the half-line	272
10.5	Solution of the problem (1.1), (1.2) for $t < 0$	274
10.6	Asymptotic behaviour of the spectral function	277
10.7	Sharpening the expansion theorem	288
11	The distribution of the eigenvalues	294
11.1	The integral equation for Green's matrix function	294
11.2	Asymptotic behaviour of the matrix $G'_\mu(x, \xi; i\mu)$ as $\mu \rightarrow \infty$	303
11.3	Other properties of the matrix $G(x, \xi; \lambda)$	310
11.4	Derivation of the bilateral asymptotic formula	316
12	The inverse problem on the half-line, from the spectral function	324
12.1	Stating the problem. Auxiliary propositions	324
12.2	Derivation of the basic integral equation	327
12.3	Solvability of the basic integral equation	331
12.4	Derivation of the differential equation	333
12.5	Derivation of the Parseval equation	336
