Contents

Preface ix

I Short Design Course 1

1 A Method for Solving System Design Problems 3
1.1 Rational functions . . . 3
1.2 The closed-loop system $\mathcal{S}$ . . . 4
1.3 Designable transfer function . . . 6
1.4 A system design problem . . . 6
1.5 The method . . . 7
1.6 Exercises . . . 9

2 Internal Stability 11
2.1 Control and stability . . . 11
2.2 Interpolation . . . 13
2.3 Systems with a stable plant . . . 15
2.4 Exercise . . . 16

3 Frequency Domain Performance Requirements 17
3.1 Introduction . . . 17
3.1.1 The closed-loop system $\mathcal{S}$ . . . 17
3.1.2 Frequency domain performance requirements . . . 18
3.1.3 Disk inequalities . . . 18
3.2 Measures of performance . . . 19
3.2.1 Gain-phase margin . . . 19
3.2.2 Tracking error . . . 21
3.2.3 Bandwidth . . . 22
3.2.4 Closed-loop roll-off . . . 23
3.2.5 Fundamental trade-offs . . . 24
3.2.6 Choosing sets of performance requirements . . . 24
3.3 Piecing together disk inequalities . . . 25
3.4 More performance measures . . . 27
3.4.1 Peak magnitude . . . 27

3.4.2 Compensator bound 27
3.4.3 Plant bound 28
3.4.4 Disturbance rejection 29
3.4.5 More on tracking error 30
3.4.6 Tracking and type n plants 31
3.5 A fully constrained problem 32

4 Optimization **35**
4.1 Review of concepts 35
4.2 Generating a performance function 36
4.3 Finding T with best performance 38
4.3.1 Example 39
4.4 Acceptable performance functions 40
4.5 Performance not of the circular type 43
4.6 Optimization 44
4.6.1 The optimization problem $OPT_{\mathcal{I}}$ 44
4.7 Internal stability and optimization 45
4.7.1 The optimization problem OPT 45
4.7.2 OPT with circular Γ 45
4.8 Exercises 46

5 A Design Example with OPTDesign **47**
5.1 Introduction 47
5.2 The problem 47
5.3 Optimization with OPTDesign 50
5.4 Producing a rational compensator 52
5.5 How good is the answer? 54
5.5.1 More on plots and functions 56
5.6 Optimality diagnostics 58
5.7 Specifying compensator roll-off 58
5.8 Reducing the numerical error 59
5.9 Rational Fits 60
5.10 Exercises 61

II More on Design **63**

6 Examples **65**
6.1 Numerical practicalities 65
6.1.1 Sampling functions on the $j\omega$ axis 66
6.1.2 Discontinuous functions 67
6.1.3 Vanishing radius function 68
6.1.4 Performance function incorrectly defined 69
6.2 Design example 1 69
6.2.1 Electro-mechanical and electrical models 69
6.2.2 Mathematical model 71

6.2.3 Statement of the problem . . . 73
6.2.4 Reformulation of requirements . . . 73
6.2.5 Optimization . . . 74
6.2.6 Second modification of the envelope and optimization . . . 78
6.3 Time domain performance requirements . . . 81
6.3.1 Two common time domain requirements . . . 83
6.3.2 A naive method . . . 83
6.3.3 A refinement of the naive method . . . 85
6.4 Design example 2 . . . 85
6.4.1 Statement of the problem . . . 86
6.4.2 Translation of time domain requirements . . . 86
6.5 Performance for competing constraints . . . 93
6.5.1 Rounding corners of performance functions . . . 94
6.5.2 Constrained optimization with a barrier method . . . 97

7 Internal Stability II **101**
7.1 Calculating interpolants . . . 101
7.1.1 Calculating one interpolant . . . 102
7.1.2 Parameterization of all interpolants . . . 103
7.1.3 Interpolation with a relative degree condition . . . 104
7.2 Plants with simple RHP zeros and poles . . . 105
7.3 Parameterization: The general case . . . 107
7.3.1 Higher-order interpolation . . . 107
7.3.2 Plants with high-multiplicity RHP zeros and poles . . . 109
7.4 Exercises . . . 110

III Appendices **113**

A History and Perspective **115**

B Downloading OPTDesign and *Anopt* **119**

C Computer Code for Example in Chapter 6 **121**
C.1 Computer code for design example 1 . . . 121
C.2 Computer code for design example 2 . . . 124

D *Anopt* Notebook **127**
D.1 Foreword . . . 127
D.2 Optimizing in the sup norm: The problem *OPT* . . . 128
D.3 Example 1: First run . . . 128
D.4 Example 2: Vector-valued analytic functions . . . 131
D.5 Example 3: Specification of more input . . . 132
D.6 Quick reference for *Anopt* . . . 135

E NewtonInterpolant Notebook **137**
E.1 First calculation of an interpolant 138
E.2 Specifying the pole location 138
E.3 Specifying of the relative degree 139
E.4 Complex numbers as data 139
E.5 Higher-order interpolation 140

F NewtonFit Notebook **143**
F.1 First example 144
F.2 Template for many runs 147
F.3 Using a weight 147
F.4 Stable zeros and poles 148

G OPTDesign Plots, Data, and Functions **151**
G.1 Functions and grids 151
G.2 Plots 153
G.3 Rational approximation and model reduction 156

References **159**

Index **169**
