

CONTENTS

Volume I - Lectures on the Calculus of Variations

Preamble

GENERALITIES AND TYPICAL PROBLEMS	2
1. Introduction	2
2. The Place of the Calculus of Variations in Relation to the Rest of Mathematics and to Space Science	3
3. Statement of the Simplest Problem and Some Cognate Matters	4
4. Extremals in Some Classical Problems	7
5. Solutions of the Preceding Problems (a), (b), (c)	9
6. The Euler-Lagrange Lemma and Schwartz Distributions	16
7. Alternative Forms of the Lemma	18
8. Proof of the Main Form of the Lemma	19
9. First Variation, Euler Equation, Transversality	21
10. Perron's Paradox	22

Chapter I

THE METHOD OF GEODESIC COVERINGS	24
11. Introduction	24
12. The Variational Algorithm of Huygens	25
13. A Link with Elementary Convexity	27
14. Reappearance of the Euler Equation	30
15. The Theorem of Malus	32
16. Sufficient Conditions for Independence of the Hilbert Integral	34
17. Invariance Properties and an Envelope Theorem	35
18. General Comments and the Applications to Plane Problems	38
19. Background on Fix-Points and on Existence Theorems for Differential Equations and Implicit Functions	40

Chapter II

DUALITY AND LOCAL EMBEDDING	46
20. Introduction	46
21. The Legendre Transformation	46

22. The Hamiltonian and its Properties	47
23. Cauchy Characteristics	49
24. Duality and the Standard Hamiltonian in the Parametric Case	50
25. Other Admissible Parametric Hamiltonians	53
26. Local Passage from Parametric to Nonparametric Case	55
27. The Embedding of Small Extremals in Small Tubes	56
28. Local Existence Theory for Nonparametric Variational Problems and for Ordinary Second Order Differential Equations	58
29. Local Parametric Existence Theory for the Elliptic Case	64

Chapter III

EMBEDDING IN THE LARGE	70
30. Introduction	70
31. First and Second Variations and Transversality	71
32. The Second Variation Fallacy	73
33. The Secondary Hamiltonian	74
34. Geometrical Interpretation of Exactness	76
35. Distinguished Families	78
36. Canonical Embeddings and Focal Points	81
37. The Jacobi Theory of Conjugate Points	83
38. The Index of Stability of an Extremal	88
39. The Second Stage of the Morse Theory	92

Chapter IV

HAMILTONIANS IN THE LARGE, CONVEXITY, INEQUALITIES AND FUNCTIONAL ANALYSIS	94
40. Introduction	94
41. Center of Gravity and Dispersal Zone	95
42. Convexity and the Hahn-Banach Theorem	98
43. The Conceptual Heritage of Georg Cantor	101
44. Duality of Convex Figures	105
45. Duality of Convex Functions	108
46. Hamiltonians in the Large and Reformulated Variational Theory	110
47. Remarks on Classical Inequalities	112
48. The Dual Unit Ball of a Functional Space	113
49. The Riesz Representation	118

Chapter V

EXISTENCE THEORY AND ITS CONSEQUENCES	122
50. Introduction	122
51. The Hilbert Construction and Some of its Consequences in the Standard Parametric Case	123

52. The Parametric Theory of Conjugate Points and the Parametric Jacobi Condition128

53. The Tonelli-Carathéodory Unicity Theorem133

54. Absolute and Homotopic Minima on $B \cdot \cdot i$ -Compact Domains and Manifolds143

55. Toward an Automatic Existence Theory147

56. First Stage of an Abstract Approach: Semicontinuity in a $B \cdot \cdot i$ -Compact Set151

57, 58, 59154

Chapter VI

GENERALIZED CURVES AND FLOWS.....155

60. Introduction155

61. Intuitive Background156

62. A Question of Semantics160

63. Parametric Curves in the Calculus of Variations.....161

64. Admissible Curves as Elements of a Dual Space163

65. A Human Analogy165

66. Generalized Curves and Flows, and Their Boundaries166

67. Parametric Representation of Generalized Curves.....171

68. Existence of a Minimum178

69. The Nature of the Generalized Solutions179

Appendix I

SOME FURTHER BASIC NOTIONS OF CONVEXITY AND INTEGRATION184

70. Introduction184

71. Separation Theorem for a Convex Cone in $\mathcal{C}_0(A)$184

72. The Lemma of the Insufficient Radius185

73. The Dual Separation Theorem.....187

74. A Localization Lemma for a $B \cdot \cdot i$ -Compact Set.....188

75. Riesz Measures189

76. Euclidean Approximation to a Banach Vector Function190

77. An Elementary Norm Estimate190

78. Vector Integration191

79. Closure of a Convex Hull192

Appendix II

THE VARIATIONAL SIGNIFICANCE AND STRUCTURE OF GENERALIZED FLOWS194

80. Introduction194

81. Polygonal Flows195

82.	The Basis of Modern Duality in the Calculus of Variations	197
83.	The Variational Convexity Principle in its Elementary Form	197
84.	A First Extension	198
85.	The Enlargement Principle and the First Closure Theorem for Generalized Flows	199
86.	The Extension to Consistent Flows and Boundaries	200
87.	Preliminary Information on Mixtures and on the Lagrange Representation	202
88.	Further Comments on Measures, Mixtures, and Consistent Flows . .	204
89.	The Lagrange Representation of a Consistent Flow	209

Volume II-Optimal Control Theory

Preamble

THE NATURE OF CONTROL PROBLEMS	214
1. Introduction	214
2. The Multiplier Rule	215
3. Optimal Control and the Lagrange Problem	217
4. The Sad Facts of Life	218
5. A First Revision of the Euler Equation and of the Multiplier Rule . .	220
6. The Weierstrass Condition, Transversality, Hamiltonians and a Strong Revised Euler Recipe	222
7. The Classical Constrained Hamiltonians	224
8. Controls and the Maximum Principle	228
9. The Maximum Principle and Its Special Cases as Definitions	231
10. Solutions of Two Elementary Time-Optimal Problems	233

Chapter I

NAIVE OPTIMAL CONTROL THEORY	243
11. Introduction	243
12. Discrete Time and Programming	244
13. Some Basic Remarks on Linear Differential Equations	247
14. Suspected Solutions of the Simplest Time-Optimal Problems	250
15. Unicity and Optimality	251
16. Two Dimensional Problems: Switching Times and Basic Con- structions	253
17. Discussion of Case (a)	256
18. Discussion of Case (b ₁)	257
19. Discussion of Case (b ₂)	259

Chapter II

THE APPLICATION OF STANDARD VARIATIONAL METHODS TO OPTIMAL CONTROL	261
20. Introduction	261
21. Trajectories and Lines of Flight	263
22. The Synchronization Condition and the Notions of Standard Projection and Descriptive Map	266
23. The Notion of a Spray of Flights	267
24. The Hilbert Independence Integral	269
25. Preliminary Lemmas	272
26. The Theorem of Malus	274
27. Chains of Flights	275
28. Piecing Together Fragments of Curves	276
29. The Fundamental Theorem and Its Consequences	279

Chapter III

GENERALIZED OPTIMAL CONTROL	282
30. Introduction	282
31. The Preproblem	285
32. More Semantics	287
33. Conventional and Chattering Controls in Differential Equations	289
34. The Halfway Principle and the Filippov Lemma	292
35. Unicity and a Key Lemma for Approximations	297
36. Control Measures	300
37. A Proper Setting for Optimal Control Problems	304
38. Hilbert's Principle of Minimum	307
39. Pontrjagin's Maximum Principle	308
39A. The Perturbation	312
39B. Reduction to a Separation Theorem	316
39C. An Equivalent Form of the Separation	318
39D. Proof of the Maximum Principle	319
39E. Epilogue	321
REFERENCES	323
INDEX	327
