PREFACE TO THE ENGLISH EDITION	xi
INTRODUCTION	xiii
0. A space of elementary events	xvii
Part I. Elementary Theory	
Chapter 1. Basic Notions	2
1. Probability distributions on discrete spaces of elementary events	2
Elementary probabilities. Events and their probabilities. Properties of probability measures. Summation theorem. Continuity property. Probability space.	
Appendix to Section 1. Particular classical schemes	7
Permutations. Partitions into groups. Allocations of particles into cells. Random sampling with and without replacement.	
2. Independence of events and sequences of trials	12
Definitions and examples. Bernoulli's scheme. The multinomial scheme.	
3. Conditional probability	17
Definitions and examples. The formula of total probability. Ruin problem. Bayes' formula.	
4. Random variables	24
One-dimensional random variables. Joint distributions of random variables. Convolutions. Conditional distributions.	
5. Expectation	30
Definitions and examples. Properties of expectation. Conditional expectations. The formula of total expectation. Regression. The conditional expectation with respect to a complete set of disjoint events.	
6. Variance	40
Definitions and examples. Two properties of variance. Standard scaling (or normalization). Bienayme's equality. Sums of independent random variables. Arithmetic mean of random variables.	
7. Higher moments and inequalities for deviations	46
Moments. Jensen's inequality. Basic inequality for deviations.	

Chapter 2. The Law of Large Numbers. Limit Theorems for Bernoulli's Scheme	50
8. The law of large numbers	50
Convergence in probability. The weak law of large numbers.	
Convergence of expectations. Bernstein's polynomials.	
Appendix to Section 8	55
Zero-sum games. St. Petersburg's paradox. Relative stability.	
Utility function. The simplest model of insurance.	
9. De Moivre–Laplace theorems	60
The local theorem. The integral theorem. On the accuracy of approximation. Proof of the local theorem.	
10. The Poisson theorem and the simplest flow of events	65
The Poisson theorem. The simplest flow of events. The convolution of Poisson's distributions.	

Chapter 3. Generating Functions and Random Walks	70
11. Generating functions (g.f.'s)	70
Definition and basic properties. The generating function of the sum of random variables. The generating function of the sum of a random number of random variables. The extinction problem or the Galton–Watson process. The generating function of a convolution. Continuity theorem. The Poisson theorem for nonidentically distributed summands.	
12. On random walks	78
"Return to zero". The arcsine law. The number of "draws".	

Part II. General Theory

Chapter 1. Foundations of the Theory	88
1. Preliminary constructions	88
Probability measure. Random variables and their expectations.	
2. Probability distributions	93
Events. Measures and probabilities. Continuity property.	
Products of probability spaces.	
3. Random variables	103
Measurability. Convergence of random variables.	
The Lebesgue integral or expectation of an elementary random variable. The Lebesgue integral: expectation of an arbitrary	

random variable. The integral over a set and the restriction of a measure. Passage to the limit under the integral sign. Comparing the Riemann and Lebesgue integrals. Integrals with respect to σ -finite measures. The theorem on iterated integrals. Absolute continuity and the Radon–Nikodym theory. Concluding remarks.

Chapter 2. Distributions on Finite-Dimensional Spaces	120
4. Distributions of random variables	120
Induced distributions. Absolutely continuous distributions.	
Discrete distributions. Mixtures. Distribution functions (d.f.'s). Singular distributions. The Lebesgue expansion.	
Lebesgue–Stieltjes integral. Linear transforms of random variables and types of distributions.	
5. Distributions of random vectors	135
Definitions and examples. Linear transforms of random vectors. Independent random variables. Convolutions.	
6. Some particular distributions on the real line	144
The uniform type. The normal type. The exponential type and the “lack of memory” property. Gamma-distributions. A connection between the Poisson and exponential distributions. χ^2 -distribution.	
7. Covariance analysis and multivariate normal distribution	157
Covariance. Covariance matrix. Properties of covariance matrices. The method of principal components or main factors. Standard normal distribution in \mathbf{R}^k . Normal distribution in \mathbf{R}^k .	
8. Convergence of distributions	163
Weak or proper convergence. Convergence of moments. Stochastic boundedness and the selection theorem. Improper convergence. Proximity of distributions. Other types of convergence of distributions. Multidimensional case. Proofs of Theorems 1–1' and Lemma 4. Proof of Theorem 2. Proofs of Theorems 3–3'. Proofs of Theorems 4–5.	
9. Comparison of distributions	181
Preference relation or ordering. Calculability. Primary conditions. Comparison based on expectation and variance. Continuity conditions. Expectation as a criterion. Utility function. Utility function and Condition A1.	

Jensen's inequality. Utility function and Condition A2.
Generalization of Theorem 2. Allais' paradox and nonlinear functionals.

Chapter 3. Conditional Distributions	200
10. Conditional distributions and expectations	201
The discrete case. The absolutely continuous case. The general case. Properties of conditional expectation. The formula of total expectation. A regression function and a prediction problem. Linear regression. The convolution formula. Product of independent random variables. Ratio of independent random variables. A system of equations with random coefficients. The Student distribution.	
11. Conditional expectations with respect to σ-algebras of events	217
Basic notions. Properties of conditional expectation. Conditional distributions. Derivation of representation (5) from Section 10.	
Chapter 4. Some Kinds of Dependence	226
12. Conditionally independent and exchangeable random variables	226
Mixtures of distributions. Conditionally independent random variables. Symmetrically dependent or exchangeable random variables.	
13. Martingales	233
Definitions, properties and examples. Markov moments and boundary problems. Continuity properties. Proof of De Finetti theorem.	
14. Markov chains	243
Basic notions and properties. Ergodicity property.	
Chapter 5. Limit Theorems	260
15. Limit theorems for maxima and minima. Regularly varying functions	261
The statement of the problem. Preliminary result. Regularly varying functions. Limit theorems for identically distributed random variables. Proofs of Theorems 1–2. The general scheme.	

16. Characteristic functions and the first limit theorems for sums	273
<p>The Laplace transform. Elementary properties of characteristic functions. Examples of characteristic functions. Characteristic functions of lattice distributions. The characteristic function of a mixture of distributions. Uniqueness and continuity theorems. On smoothness of characteristic functions. The law of large numbers for identically distributed summands. Convergence of sums of identically distributed summands to a normal distribution: Lévy's theorem. A limit theorem for sums of rotations.</p>	
17. Characteristic functions, inversion theorems	287
<p>Lattice distributions. Absolutely continuous distributions. The inverse in the general case: smoothing. An inversion formula based on the Dirichlet integral. Truncation inequalities. Proofs of the continuity theorems. Generalization of the continuity theorem.</p>	
18. Limit theorems for sums. The case of finite variances	301
<p>Preliminary statement of the problem. Triangular arrays. Conditions for normal convergence: sufficiency. Conditions for normal convergence: necessity. Convergence to the Poisson distribution. The theorem on proximity of convolutions. Lindeberg's theorem follows from Theorem 5. Proof of Theorem 5. Proof of Feller's theorem. Development of Theorem 4 from Theorem 5.</p>	
19. Stable distributions	318
<p>Stability property. The stability of limiting distributions. The case of finite variances. Symmetric stable distributions. On the density of symmetric stable distributions. Stable distributions in the general case. Convergence to stable distributions. Proof of the theorem on the number of draws. Additional remarks.</p>	
20. Limit theorems for sums. The general case	341
<p>Centering. Rescaling. The general scheme of summation. Proof of Theorem 1. Convergence to stable distributions.</p>	
21. On large deviations	354
<p>The statement of the problem. A theorem on large deviations. An inequality for large deviations. Proof of Theorem 2.</p>	

22. Characteristic functions and limit theorems in the multidimensional case	358
<p>Characteristic functions. Uniqueness and continuity theorems. The multidimensional analog of Lévy's theorem. Limit theorems for some nonlinear functions of many random arguments.</p>	
23. Limit theorems for dependent summands	366
<p>Preliminary examples. Random summands with two values. Limit theorems for an infinite sequence of symmetrically dependent random variables. Limit theorems for martingales. The derivation of Theorem 6 from Theorem 7. Proof of Theorem 7. Limit theorems for random variables defined on a Markov chain.</p>	
24. Nonlinear limit theorems	382
<p>The general statement of the problem. Multilinear forms and polynomials of random variables.</p>	
Chapter 6. Almost Sure Behavior of Sums of Random Variables	390
25. The Borell–Cantelli theorem and the “zero-one” law	390
<p>The Borell–Cantelli theorem. The “zero-one” law.</p>	
26. The strong law of large numbers (SLLN) and the law of the iterated logarithm	394
<p>The strong law of large numbers: necessity. The Kolmogorov and Lévy inequalities. A theorem on convergence of martingales or a criterion of convergence of series. The strong law of large numbers: sufficiency. The strong law of large numbers for independent identically distributed random variables. The law of the iterated logarithm.</p>	
27. The law of large numbers and stochastic optimization problems	405
<p>The simplest stochastic optimization scheme. The case of dependent observations. On the general scheme of stochastic optimization.</p>
