Preface ix List of notation xiii

PART A: THE CLASSICAL PROBLEM

1 Van der Corput's conjecture	3
1.1 Roth's formulation of the problem	4
1.2 Application to approximate evaluation of certain functions	7
1.3 A question of Erdős	10
2 Lower bounds – Roth's method	14
2.1 Roth's orthogonal function method	14
2.2 Halász's variation of Roth's method	20
2.3 Application to approximate evaluation of certain functions	28
2.4 An application of Halász's method	32
3 Upper bounds	39
3.1 Davenport's theorem and Roth's variation	39
3.2 Halton's theorem. Faure's theorem	48
3.3 Roth's probabilistic method	55
3.4 An inductive argument using Roth's probabilistic method	59
3.5 A variation of Roth's probabilistic method	73
4 Lower bounds – a combinatorial method of Schmidt	79
4.1 The key inequality	79
4.2 The problem of van Aardenne-Ehrenfest and a question of Erdős	80
4.3 The scarcity of intervals with bounded error	87
4.4 A variation of the method and application to a problem of Erdős in diophantine approximation	92

PART B: GENERALIZATION OF THE CLASSICAL PROBLEM

5 Schmidt's work	105
5.1 An illustration of the method of integral equations	108
5.2 Balls in the unit torus	114
5.3 Solving the integral equations	121
6 A Fourier transform approach	127
6.1 Demonstration of the method on two examples	132
6.2 Balls contained in the unit cube – a 'truncation' technique	140
6.3 Similar convex sets	153

7 Further applications of the Fourier transform method	173
7.1 Homothetic convex sets	182
7.2 Congruent sets	209
7.3 Roth's conjecture on disc-segments	218
7.4 Spherical caps and a geometric application	225
8 More upper bounds	229
8.1 A probabilistic method	229
8.2 A hypergraph 2-colouring approach	240
8.3 Applications of the combinatorial lemmas	251
PART C: MORE PROBLEMS!	
9 Miscellaneous questions	277
9.1 Arithmetic progressions	277
9.2 Unsolved problems on point distributions	283
References	286
Index of theorems and corollaries	289
Index of names	291
Index	292
